UNIVERSITATIS

ALBERTAE

ASA
This drawing (about two-fifths of the linear size of the original) is made from a photograph of a miniature painted in an old MS. (written in 1456 at the Hague by Jean Mielot, Secretary to Philip the Good, Duke of Burgundy), now in the Paris National Library (MS. Fonds français 9,198). It depicts Jean Mielot himself, writing upon a scroll (said to be his “Miracles of Our Lady”). His parchment appears to be held steady by a weight and also by (the knife or filler in) his left hand—compare fig. 41 in this book. Above there is a sort of reading desk, holding MSS. for copying or reference.
EDITOR'S PREFACE

In issuing these volumes of a series of Handbooks on the Artistic Crafts, it will be well to state what are our general aims.

In the first place, we wish to provide trustworthy text-books of workshop practice, from the points of view of experts who have critically examined the methods current in the shops, and putting aside vain survivals, are prepared to say what is good workmanship, and to set up a standard of quality in the crafts which are more especially associated with design. Secondly, in doing this, we hope to treat design itself as an essential part of good workmanship. During the last century most of the arts, save painting and sculpture of an academic kind, were little considered, and there was a tendency to look on "design" as a mere matter of appearance. Such "ornamentation" as existed was usually obtained by following in a mechanical way a drawing provided by an artist who often knew little of the technical processes involved in production. With the critical attention given to the crafts by Ruskin and Morris, it came to be seen that it was impossible to detach design from craft in this way, and that, in the widest sense, true design
Editor's Preface

is an inseparable element of good quality, involving as it does the selection of good and suitable material, contrivance for special purpose, expert workmanship, proper finish, and so on, far more than mere ornament, and indeed, that ornamentation itself was rather an exuberance of fine workmanship than a matter of merely abstract lines. Workmanship when separated by too wide a gulf from fresh thought—that is, from design—inevitably decays, and, on the other hand, ornamentation, divorced from workmanship, is necessarily unreal, and quickly falls into affectation. Proper ornamentation may be defined as a language addressed to the eye; it is pleasant thought expressed in the speech of the tool.

In the third place, we would have this series put artistic craftsmanship before people as furnishing reasonable occupations for those who would gain a livelihood. Although within the bounds of academic art, the competition, of its kind, is so acute that only a very few per cent. can fairly hope to succeed as painters and sculptors; yet, as artistic craftsmen, there is every probability that nearly every one who would pass through a sufficient period of apprenticeship to workmanship and design would reach a measure of success.

In the blending of handwork and thought in such arts as we propose to deal with, happy careers may be found as far removed from the dreary routine of hack labour as from the terrible uncertainty of academic art. It is desirable in every way that men
of good education should be brought back into the productive crafts: there are more than enough of us "in the city," and it is probable that more consideration will be given in this century than in the last to Design and Workmanship.

Of all the Arts, writing, perhaps, shows most clearly the formative force of the instruments used. In the analysis which Mr. Johnston gives us in this volume, nearly all seems to be explained by the two factors, utility and masterly use of tools. No one has ever invented a form of script, and herein lies the wonderful interest of the subject; the forms used have always formed themselves by a continuous process of development.

The curious assemblages of wedge-shaped indentations which make up Assyrian writing are a direct outcome of the clay cake, and the stylus used to imprint little marks on it. The forms of Chinese characters, it is evident, were made by quickly representing with a brush earlier pictorial signs. The Roman characters, which are our letters to-day, although their earlier forms have only come down to us cut in stone, must have been formed by incessant practice with a flat, stiff brush, or some such tool. The disposition of the thicks and thins, and the exact shape of the curves, must have been settled by an instrument used rapidly; I suppose, indeed, that most of the great monumental inscriptions were designed \textit{in situ} by a master writer, and only cut in
by the mason, the cutting being merely a fixing, as it were, of the writing, and the cut inscriptions must always have been intended to be completed by painting.

The "Rustic letters" found in stone inscriptions of the fourth century are still more obviously cursive, and in the Catacombs some painted inscriptions of this kind remain which perfectly show that they were rapidly written. The ordinary "lower case" type with which this page is printed is, in its turn, a simplified cursive form of the Capital letters. The Italic is a still more swiftly written hand, and comes near to the standard for ordinary handwriting.

All fine monumental inscriptions and types are but forms of writing modified according to the materials to which they are applied. The Italian type-founders of the fifteenth century sought out fine examples of old writing as models, and for their capitals studied the monumental Roman inscriptions. Roman letters were first introduced into English inscriptions by Italian artists. Torrigiano, on the tombs he made for Henry VII. in Westminster Abbey and for Dr. Young at the Rolls Chapel, designed probably the most beautiful inscriptions of this kind to be found in England.

This volume is remarkable for the way in which its subject seems to be developed inevitably. There is here no collection of all sorts of lettering, some sensible and many eccentric, for us to choose from, but we are shown the essentials of form and spacing,
and the way is opened out to all who will devote practice to it to form an individual style by imperceptible variations from a fine standard.

Writing is for us the most universal of the Arts, and most craftsmen have to deal with lettering of a more formal kind. It is a commonplace of historical criticism to point out how much the Italian artists owed to the general practice amongst them of goldsmith's work, a craft which required accuracy and delicacy of hand. We cannot go back to that, but we do need a basis of training in a demonstrably useful art, and I doubt if any is so generally fitted for the purpose of educating the hand, the eye, and the mind as this one of writing.

W. R. LETHABY.
“We must set up the strong present tense against all the 
rumours of wrath, past or to come. So many things are 
unsettled which it is of the first importance to settle,—and, 
pending their settlement, we will do as we do. ... Exped-
diency of literature, reason of literature, lawfulness of writ-
ing down a thought, is questioned; much is to say on both 
sides, and, while the fight waxes hot, thou, dearest scholar, 
stick to thy foolish task, add a line every hour, and between 
whiles add a line. Right to hold land, right of property is 
disputed, and the conventions convene, and before the vote is 
taken, dig away in your garden, and spend your earnings as 
a waif or godsend to all serene and beautiful purposes. Life 
itsel is a bubble and a scepticism, and a sleep within a sleep. 
Grant it, and as much more as they will,—but thou, God’s 
darling! heed thy private dream: thou wilt not be missed in 
the scorning and scepticism: there are enough of them: stay 
there in thy closet, and toil, until the rest are agreed what 
to do about it. Thy sickness, they say, and thy puny habit, 
require that thou do this or avoid that, but know that thy 
life is a fleeting state, a tent for a night, and do thou, sick or 
well, finish that stint. Thou art sick, but shalt not be 
worse, and the universe, which holds thee dear, shall be the 
better.”

—Emerson.

“I began to think that if I should discover how to make 
enamels, I could make earthen vessels and other things very 
prettily, because God had gifted me with some knowledge of 
drawing. And thereafter, regardless of the fact that I had 
no knowledge of drugs, I began to seek for the enamels as a 
man gropes in the dark.”

—Palissy.

“. . . in that communion only, beholding beauty with 
the eye of the mind, he will be enabled to bring forth, not 
images of beauty, but realities (for he has hold not of an 
image but of a reality), and bringing forth and nourishing 
true virtue to become the friend of God and be immortal, if 
mortal man may.”

—Plato.
The arts of WRITING, ILLUMINATING, & LETTERING offer a wide field for the ingenious and careful craftsman and open the way to a number of delightful occupations. Beyond their many uses—some of which are referred to below—they have a very great educational value. This has long been recognized in the teaching of elementary design, and the practice of designing Alphabets and Inscriptions is now common in most Schools of Art. Much would be gained by substituting, generally, WRITING for designing, because writing being the medium by which our letters have been evolved, the use of the pen—essentially the letter-making tool—gives a practical insight into the construction of letters attainable in no other way. The most important use of letters is in the making of books, and the foundations of typography and book decoration may be mastered—as they were laid—by the planning, writing, and illuminating of MSS. in book form. Of this a modern printer, Mr. T. J. Cobden-Sanderson, says:

"In the making of the Written Book, . . . . . . . the adjustment of letter to letter, of word to word, of picture to text and of text to picture, and of the whole to the subject-matter and to the page, admits of great nicety and perfection. The type is fluid, and the letters and words, picture, text, and page are conceived of as one and are all executed by one hand, or by several hands all working
together without intermediation on one identical page and with a view to one identical effect. In the Printed Book this adjustment is more difficult. . . . . Yet in the making of the printed book, as in the making of the written book, this adjustment is essential, and should be specially borne in mind, and Calligraphy and immediate decoration by hand and the unity which should be inseparably associated therewith would serve as an admirable discipline to that end.” (And see p. 368 below.)

And though calligraphy is a means to many ends, a fine MS. has a beauty of its own that—if two arts may be compared—surpasses that of the finest printing. This in itself would justify the transcribing and preservation of much good literature in this beautiful form (besides the preparation of “Illuminated Addresses,” Service Books, Heraldic and other MSS.) and make the practice of formal writing desirable. And furthermore as the old-fashioned notion that a legible hand is a mark of bad breeding dies out, it may be that our current handwriting will take legibility and beauty from such practice. And even the strict utilitarian could not fail to value the benefits that might some day come to men, if children learnt to appreciate beauty of form in their letters, and in their writing the beauty of carefulness.

Of the practice of illuminating—properly associated with writing—it may be observed that, among various ways of acquiring a knowledge of the elements of design & decoration it is one of the most simple and complete. Moreover, a fine illumination or miniature has a beauty of its own that may surpass the finest printed book-decoration. And pictures in books may be as desirable as pictures on the wall—even though like the beautiful
household gods of the Japanese they are kept in safe
hiding and displayed only now and then.

Magnificent as are the dreams of a fine Decoration based on lettering, the innumerable practical
applications of lettering itself (see Chap. XVI.)
make the study of Letter-Craft not only desirable
but imperative. And perhaps I may here be per-
mitted to quote from The Athenæum of Feb. 3,
1906, which says of “the new school of scribes
and designers of inscriptions”

“These have attacked the problem of applied design
in one of its simplest and most universal applications,
and they have already done a great deal to establish a
standard by which we shall be bound to revise all printed
and written lettering. If once the principles they have
established could gain currency, what a load of ugliness
would be lifted from modern civilization! If once the
names of streets and houses, and, let us hope, even the
announcements of advertisers, were executed in beautifully
designed and well-spaced letters, the eye would become
so accustomed to good proportion in these simple and
obvious things that it would insist on a similar gratifica-
tion in more complex and difficult matters.”

Yet Ordinary Writing and even scribbling has
had, and still might have, a good influence on the
art of the Letter maker, and at least the common
use of pen, ink, & paper makes it a simple matter
for any one to essay a formal or ‘book’ hand.
A broad nib cut to give clean thick and thin strokes
(without appreciable variation of pressure) will teach
any one who cares to learn, very clearly and cer-
tainly. And though much practice goes to the
making of a perfect MS., it is easier than people sup-
pose to make really beautiful things by taking a little
pains. As “copy book” hands simple, primitive
pen-forms—such as the Uncial & Half-Uncial (pp. 38, 70)—afford the best training and permit the cultivation of the freedom which is essential in writing; they prepare the way for the mastery of the most practical characters—the Roman Capital, Roman small-letter, & Italic—and the ultimate development of a lively and personal penmanship.

Developing, or rather re-developing, an art involves the tracing in one's own experience of a process resembling its past development. And it is by such a course that we, who wish to revive Writing & Illuminating, may renew them, evolving new methods and traditions for ourselves, till at length we attain a modern and beautiful technique. And if we would be more than amateurs, we must study and practise the making of beautiful things and thereby gain experience of Tools, Materials, and Methods. For it is certain that we must teach ourselves how to make beautiful things, and must have some notion of the aim and bent of our work, of what we seek and what we do.

Early illuminated MSS. and printed books with woodcuts (or good facsimiles) may be studied with advantage by the would-be Illuminator, and he should if possible learn to draw from hedgerows and from country gardens. In his practice he should begin as a scribe making MS. books and then decorating them with simple pen & colour work. We may pass most naturally from writing to the decoration of writing, by the making and placing of initial letters. For in seeking first a fine effectiveness we may put readableness before "looks" and, generally, make a text to read smoothly, broken only by its natural division into paragraphs, chapters,
and the like. But these divisions, suggesting that a pause in reading is desirable, suggest also that a mark is required—as in music—indicating the "rest": this a large capital does most effectively.

A technical division of illumination into Colour-work, Pen-work, and Draughtsmanship is convenient (see Chap. XI.) Though these are properly combined in practice, it is suggested that, at first, it will be helpful to think of their effects as distinct so that we may attain quite definitely some mastery of pure, bright, colours & simple colour effects, of pen flourishing and ornament, and of drawing—whether plain or coloured, that will go decoratively with writing or printing. This distinction makes it easier to devise definite schemes of illumination that will be within our power to carry out at any stage of our development. And while the penman inevitably gains some power of pen decoration it is well for him as an illuminator to practise in bright colours and gold; for illumination may be as brilliant and splendid in its own way as stained glass, enamels, and jewellery are in theirs. At first, at any rate, hues that have the least suspicion of being dull or weak are to be avoided as though they were plainly "muddy" or "washed-out." The more definite we make our work the more definitely will our materials instruct us; and such service must precede mastery.

Referring again to good lettering: the second part of this book deals with some of its Qualities, Forms—the Roman Capitals & their important pen-derivatives—and Uses. It is written largely from

1 See Chap. XVI. "Of Colour" in "Stained Glass Work" by C. W. Whall, in this Series, and the illuminator might profit by the suggestion (ibid., p. 232) of playing with a home-made kaleidoscope.
the penman’s point of view, but a chapter on inscriptions in stone has been added and various types and modes of letter making are discussed. The essential qualities of Lettering are legibility, beauty, and character, and these are to be found in numberless inscriptions and writings of the last two thousand years. But since the traditions of the early scribes and printers and carvers have decayed, we have become so used to inferior forms and arrangements that we hardly realize how poor the bulk of modern lettering really is. In the recent “revival” of printing and book decoration, many attempts have been made to design fine alphabets and beautiful books—in a number of cases with notable success. But the study of Palæography and Typography has hitherto been confined to a few specialists, and these attempts to make “decorative” books often shew a vagueness of intention, which weakens their interest and an ignorance of Letter-craft which makes the poorest, ordinary printing seem pleasant by comparison. The development of Letters was a purely natural process in the course of which distinct and characteristic types were evolved and some knowledge of how these came into being will help us in understanding their anatomy and distinguishing good and bad forms. A comparatively little study of old manuscripts and inscriptions will make clear much of the beauty and method of the early work. And we may accustom ourselves to good lettering by carefully studying such examples as we can find, and acquire a practical knowledge of it by copying from them with a pen or chisel or other letter-making

1 Dealing with the practical and theoretical knowledge of letter-making and arrangement which may be gained most effectively by the use of the pen.
ool. A conscientious endeavour to make our letter¬
ing readable, and models\(^1\) and methods chosen to
that end, will keep our work straight: and after
all the problem before us is fairly simple—To make
good letters and to arrange them well. To make
good letters is not necessarily to "design" them
—they have been designed long ago—but it is to
take the best letters we can find, and to acquire
them and make them our own. To arrange letters
well requires no great art, but it requires a work¬
ing knowledge of letter-forms and of the reason¬
able methods of grouping these forms to suit every
circumstance.

Generally this book has been planned as a sort of
"guide" to models and methods for Letter-crafts¬
men and Students—more particularly for those who
cannot see the actual processes of Writing, Illumi¬
nating, &c. carried out, and who may not have
access to collections of MSS. Much of, if not all,
the explanation is of the most obvious, but that, I
hope, gives it more nearly the value of a practical
demonstration. In describing methods and processes
I have generally used the present tense—saying that
they "are"—this is to be taken as meaning that
they are so in early MSS. and inscriptions, and in
the practice of the modern school of scribes who
found their work on them.

Regarding the copying of early work (see pp. 195,
323, &c.) it is contended that to revive an art one
must begin at the beginning, and that, in an honest
attempt to achieve a simple end, one may lawfully

\(^1\) In making choice of a model we seek an essentially legible
close to favour custom and use unduly, for a quite bad, familiar
character, remembering that our personal view of legibility
writing may seem to us more readable than one that is far
clearer in itself but unfamiliar.

xix
follow a method without imitating a style. We have an excellent precedent in the Italian scribes who went back 300 years for a model and gave us the Roman small-letter as a result (see p. 47). The beginner’s attitude is largely, and necessarily, imitative, and at this time we should have much to hope from a school of Artist-Beginners who would make good construction the only novelty in their work. We have almost as much—or as little—to be afraid of in Originality as in imitation, and our best attitude towards this problem is that of the Irishman with a difficulty—“to look it boldly in the face and pass on”—making an honest attempt to achieve a simple end. Perhaps we trouble too much about what we “ought to do” & “do”: it is of greater moment to know what we are doing & trying to do. In so far as tradition fails to bound or guide us we must think for ourselves and in practice make methods and rules for ourselves: endeavouring that our work should be effective rather than have “a fine effect”—or be, rather than appear, good—and following our craft rather than making it follow us. For all things—materials, tools, methods—are waiting to serve us and we have only to find the “spell” that will set the whole universe a-making for us.

Endeavouring to attain this freedom we may make Rules and Methods serve us (see p. 221),

1 Much remains to be found out and done in the matter of improving tools & materials & processes, and it would be preferable that the rediscovery of simple, old methods should precede new & complex inventions. We still find the Quill—for its substance & for shaping it and keeping it sharp—is a better tool than a modern gold or metal pen (see p. 60). The old parchment, paper, ink, gilding-size & colours are all much better than those now obtainable (see pp. 51, 167, 173, 178–179). I should greatly appreciate any advice from illuminators and letter-craftsmen as to materials and methods, and should endeavour to make such information available to others.—E. J.
knowing that Rules and only Guides and that Methods are suggested by the work itself: from first to last our necessary equipment consists in good models, good tools, & a good will. Within the limits of our craft we cannot have too much freedom; for too much fitting & planning makes the work lifeless, and it is conceivable that in the finest work the Rules are concealed, and that, for example, a MS. might be most beautiful without ruled lines and methodical arrangement (see p. 343). But the more clearly we realize our limitations the more practical our work. And it is rather as a stimulus to definite thought—not as an embodiment of hard and fast rules—that various methodical plans & tables of comparison & analysis are given in this book. It is well to recognize at once, the fact that mere taking to pieces, or analysing, followed by “putting together,” is only a means of becoming acquainted with the mechanism of construction, and will not reproduce the original beauty of a thing: it is an education for work, but all work which is honest and straightforward has a beauty and freshness of its own.

The commercial prospects of the student of Writing & Illuminating—or, indeed, of any Art or Craft—are somewhat problematical, depending largely on his efficiency & opportunities. There is a fairly steady demand for Illuminated Addresses; but the independent craftsman would have to establish himself by useful practice, and by seizing opportunities, and by doing his work well. Only an attempt to do practical work will raise practical problems, and therefore useful practice is the making of real or definite things. In the special conditions attaching to work which the craftsman is commissioned to do for another person, there is a great advantage.
And the beginner by setting himself specific tasks (for example: making a MS. book for a specific purpose—see p. 100) should give reality to his work. As a craftsman in Lettering he might get work in some of the directions mentioned in pp. 337–341.

Although the demand for good work is at present limited, the production of good work will inevitably create a demand; and, finally, the value of Quality is always recognized—sooner or later, but inevitably—and whatever "practical" reasons we may hear urged in favour of Quantity, the value of Quality is gaining recognition every day in commerce and even in art, and there or here, sooner or later we shall know that we can afford the best.

EDWARD JOHNSTON.

My thanks are due to Mr. T. J. Cobden-Sanderson, to Mr. Emery Walker, and to Mr. George Allen for quotations: to Mr. Graily Hewitt, to Mr. Douglas Cockerell, to Mr. A. E. R. Gill, to Mr. C. M. Firth, and to Mr. G. Loumyer, for special contributions on gilding, binding, and inscription-cutting: to Mr. S. C. Cockerell for several of the plates: to Mr. W. H. Cowlishaw, to the Rev. Dr. T. K. Abbott, to Dr. F. S. Kenyon of the New Palæographical Society, to the Vicar of Holy Trinity Church, Hastings, to the Secretary of the Board of Education, S. Kensington, to Mr. H. Yates Thompson, to Mr. G. H. Powell, and to others, for permission to reproduce photographs, &c.: and to Mr. Noel Rooke and Mr. Godfrey J. Hogg for assistance with the illustrations and many other matters: I should like, moreover, to acknowledge my indebtedness to Mr. W. R. Lethaby and Mr. S. C. Cockerell for encouragement and advice in years past.

E. J.
ADDENDÆ & CORRIGENDÆ

P. 51. Beginners practising large writing may more easily use a thin, or diluted, ink: in small writing this does not show up the faults with sufficient clearness.

P. 59. Quills often have a sort of skin (which tends to make a ragged nib), this should be scraped off the back.

Pp. 63 Until the simple pen-stroke forms are mastered, the pen should be used without appreciable pressure. With practice one gains sleight of hand (pp. 85, 311), and slightly changing pressures & quick movements on to the corners, or points, of the nib are used. The forms in the best MSS. shew such variations; e.g. the Uncials in fig. 5 appear to have been made with varying pressure (perhaps with a soft reed) & their fine finishing-strokes with the nib-point (comp. forms in fig. 146). Versals likewise shew varying, and sometimes uncertain, structures that suggest a form consisting of strokes other than definite pen strokes.

P. 64. An ordinary strong nib may be sharpened several times, before it is re-cut, by paring it underneath (fig. a). The extra fine nib
Figs. a to n, illustrating Addenda & Corrigenda.
which is recommended for all fine and careful work, must be re-cut every time.

P. 99. The plan of a paper scale is shewn in fig. b.

P. 109. The dots for lines were often pricked through the edges of the book-sheets which were cut off after ruling (fig. c).

P. 118. The spread or wedge-shaped thin stroke, sometimes very strongly marked, is common in early forms (fig. d).

P. 144. \& \& better (pen) forms of these are shewn in fig. e.

P. 208. Ornamental Letter forms may consist of flourishes, patterns, leaves, flowers, &c. (see fig. f).

Pp. 215–217. Diapering generally means the variegation, figuring, or flowering, of a plain or patterned surface, with a finer pattern (see fig. 191a). Some diagrams of simple patterns (g–g² from modern cantagalli ware) are shown in fig. g. Note: the more solid penwork line-fillings in figs. 87, 126, make effective framing borders (see fig. h).

Pp. 219–220. Note: the principle of breaking straight or long lines, mentioned in regard to background edges (p. 190), and illustrated in the line-finishings (fig. 126) and flourishes (fig. 79), is related to branching out and is re-creative, whereas the prolonged line is tiresome (see figs. k, k¹, \& comp. k²).

P. 249. The B & D should be round-shouldered—see note to p. 280 below.
Addenda & Corrigenda

P. 260. It is sometimes better to make narrow forms than to combine wide ones—example fig. 1.
The large types — "Old Face"

Pp. 270–275. (founded on Caslon Type) and
Pp. 280–288. "Old French" (modern) respectively—are used in these pages as reference
or index letters (not as models).

P. 280. Generally round-shouldered letters have finer and more stable forms than square¬
shouldered, and generally emphasis should be laid on the strong, thick stroke running obliquely down from left to right (\), while the weak, thin stroke (/) is rather to be avoided (see fig. m). The writing used in the diagrams in this book, con¬sidered as a formal hand, shews a little too much of the thin stroke (see p. 485).

P. 324. Commonly letters are made more slender in proportion as they are made larger, and it is generally not desirable (or possible) in practical work to have exactly similar proportions in large and small lettering.

P. 325. g from fig. 173 inaccurate—comp. fig. 173 & see fig. n.

P. 331. Ornamental letters: see note to p. 208 above.

P. 481. A small writing is often the most practical—in the matter of speed in reading and less bulk in the MS., besides speed in the writing of it—but it is more difficult for the beginner to write it well and it is apt to lose some of the virtues of formal penmanship (see Fine-pen writing pp. 59, 86, 311, 324, 482).

P. 485. Oblique thin stroke: see note to p. 280 above.

CHAPTER I

THE DEVELOPMENT OF WRITING

Nearly every type of letter with which we are familiar is derived from the Roman Capitals, and has come to us through the medium, or been modified by the influence, of the pen. And, therefore, in trying to revive good Lettering, we cannot do better than make a practical study of the best pen-forms, and learn at the same time to appreciate the forms of their magnificent arche-types as preserved in the monumental Roman inscriptions.

The development and the relations of the principal types of letters are briefly set out in the accompanying "family tree"—fig. 1. When the student has learnt to cut and handle a pen, he can trace this development practically by trying to copy a few words from each example given below.
THE ROMAN ALPHABET.—The Alphabet, as we know it, begins with the Roman Capitals\(^1\) (see fig. 2). Their fine monumental forms were evolved by the use of the chisel—

![Fig. 2.](image)

probably under the influence of writing—and had reached full development about 2000 years ago (see Plates I., II., and Chapter XV.).

**FORMAL WRITING**—the "book-hand" or professional writing of the scribes—comes of the careful writing of the Roman Capitals (see also footnote, p. 38, on the beginnings of fine penmanship). It was the—

"literary hand, used in the production of exactly written MSS., and therefore a hand of comparatively limited use. By its side, and of course of far more extensive and general use, was the cursive hand of the time"\(^2\)

---

\(^1\) "The alphabet which we use at the present day \ldots \ldots is directly derived from the Roman alphabet: the Roman, from a local form of the Greek; the Greek, from the Phoenician. \ldots\"

It had been supposed that the Phoenician came from the Egyptian hieratic, but "Recent discoveries prove the existence, in very remote times, in all quarters of the Mediterranean and in Egypt, of symbols resembling certain alphabetical signs and preceding even the Egyptian hieroglyphics. The early origin of our alphabet therefore still remains to be worked out."—Sir Edward Maunde Thompson, "Greek and Latin Palaeography," 3rd edition (1906), pp. 1, 321.

\(^2\) Ibid., p. 196.
In early *cursive writing*—the running-hand or ordinary writing of the people—

"The Letters are nothing more than the old Roman letters written with speed, and thus undergoing certain modifications in their forms, which eventually developed into the *minuscule hand*" \(^1\) (See fig. 3.)

**Fig. 3.**

Here it is sufficient to trace the history of the formal Latin "hands," but the continual, modifying influence exerted on them by the ordinary *cursive* writing should be borne in mind. Notable results of this influence are seen in *Half-Uncials* and *Italics.*

*SQUARE CAPITALS* were formal, pen-made Roman Capitals, of the monumental type: they were used (perhaps from the *second*) till about the

---

\(^1\) "G. & L. Palæography," p. 204. (Minuscules = "small letters," not capitals: *conf.* printer's "lower-case." *Half-Uncials are sometimes distinguished as "round minuscules,"* p. 302, below.)
end of the fifth century for important books (see Plate III.).

RUSTIC CAPITALS were probably a variety of the "Square Capitals," and were in use till about the end of the fifth century (fig. 4; see also p. 297).

ROMAN UNCIALS were fully developed by the fourth century, and were used from the fifth till the eighth century for the finest books (fig. 5).

Uncials are true pen-forms — more quickly written than the "Square," and clearer than the "Rustic" Capitals — having the characteristic, simple strokes and beautiful, rounded shapes which flow from the rightly handled reed or quill. The

---

1 It is possible that their forms were influenced by the use of the brush in painting up public notices and the like. The introduction of the use of vellum—a perfect writing material—in the making of books, undoubtedly led to a great advance in the formality and finish of the book-hands (especially of the Uncial character); practically, it may be said to mark the beginning of penmanship as a "fine" art. This development may be assigned to the time between the first and the third centuries (palaeographical dates before the fifth century must generally be regarded as approximate).
The Development of Writing

Fig. 5.—Psalter, fifth century.
The Development of Writing

typical Uncial letters are the round D, E, H, M, U (or V), and A and Q (see p. 300).

**ROMAN HALF-UNCIALS**—or **Semi-Uncials**—(fig. 6) were mixed Uncial and Cursive forms adopted by the scribes for ease and quickness in writing. Their evolution marks the formal change from Capitals to "Small-Letters."

![Fig. 6.—S. Augustine: probably French sixth century.](image)

They were first used as a book-hand for the less important books about the beginning of the sixth century.

**IRISH HALF-UNCIALS** were founded on the Roman Half-Uncials (probably brought to Ireland by Roman missionaries in the sixth century). As a beautiful writing, they attained in the seventh century a degree of perfection since unrivalled (see Plate VI.).

They developed in the eighth and ninth centuries into a "pointed" writing, which became the Irish national hand.

**ENGLISH HALF-UNCIALS** (fig. 7) were modelled on the Irish Half-Uncials in the seventh
century. They also developed in the eighth and ninth centuries into a “pointed” writing.

**CAROLINE (or CARLOVINGIAN) WRITING.**—While English and Irish writing thus came from Roman Half-Uncial, the Continental hands were much influenced by the rougher Roman Cursive, and were comparatively poor till near the end of the eighth century.

“The period of Charlemagne is an epoch in the history of the handwritings of Western Europe. With the revival of learning naturally came a reform of the writing in which the works of literature were to be made known. A decree of the year 789 called for the revision of church books; and this work naturally brought with it a great activity in the writing schools of the chief monastic centres of France. And in none was there greater activity than at Tours, where, under the rule of Alcuin of York, who was abbot of St. Martin’s from 796 to 804, was specially developed the exact hand which has received the name of the Caroline Minuscule.”

1 “Greek and Latin Palæography,” p. 233.
Ducerae excolantere culicem clamem autem gluttienter.

Aevo obiri scribāe et pharisaēi hiāçortae quicumundatur quod deforū est calicis et parabīdir intr autemplenis sunt rapina et inmunditia. Pharisaēæ eae cæ mundaprius quod inutus est calici.
The influence of the Caroline hands (see fig. 8) presently spread throughout Europe. The letters in our modern copy-books may be regarded as their direct, though degenerate, descendants.

SLANTED-PEN or TILTED WRITING. — The forms of the letters in early writing indicate an easily held pen—slanted away from the right shoulder. The slanted pen naturally produced oblique thick strokes and thin strokes, and the thick curves were “tilted” (see fig. 9).

In the highly finished hands—used from the sixth to the eighth centuries—such as the later Uncials and the Roman, Irish, and English Half-Uncials, the pen was manipulated or cut so that the thin strokes were approximately horizontal, and the thick strokes vertical (fig. 10). The earlier and easier practice came into fashion again in the eighth and ninth centuries, and the round Irish and English hands became “pointed” as a result of slanting the pen.

The alteration in widths and directions of pen strokes, due to the use of the “slanted pen,” had these effects on the half-uncial forms (see fig. 11):

1. The thin strokes taking an oblique (upward) direction (a) (giving a sharp angle with the verticals (d, a)) led to angularity and narrower forms (a¹), and a marked contrast between thick and thin strokes—due to the abrupt change from one to the other (a²).

2. The thick strokes becoming oblique (b) caused a thickening of the curves below on the left (b¹), and above on the right (b²), which gave heavy shoulders and feet.

3. The horizontal strokes becoming thicker (c) gave stronger and less elegant forms.
The Development of Writing

**Square Rustic Uncial**

"Slanted pen": giving oblique strokes & "tilted" O letters.

**Roman Uncial**

"Straight pen": giving horizontal thin strokes, vertical thick, &

Fig. 9.

Fig. 10.
4. The vertical strokes becoming thinner (d) (with oblique or pointed ends—not square ended) increased the tendency to narrow letters.

The Development of Writing

It is to be noted that the Caroline letters—though written with a “slanted pen”—kept the open, round appearance of the earlier forms.

Fig. 11.
TENTH, ELEVENTH, AND TWELFTH CENTURY WRITING.—The easy use of the slanted pen, and the lateral compression of the letters which naturally followed, resulted in a valuable economy of time and space in the making of books. This lateral compression is strongly marked in the tenth century (see fig. 12), and in the eleventh and twelfth centuries it caused curves to give place to angles, and writing to become “Gothic” in character (see Plate XI.).

THIRTEENTH, FOURTEENTH, AND FIFTEENTH CENTURY WRITING.—The tendency to compression continued, and a further economy of space was effected in the thirteenth and fourteenth centuries by the general use of much smaller writing (see fig. 13). In the fifteenth century writing grew larger and taller again, but the letters had steadily become narrower, more angular,
and stiffer, till the written page consisted of rows of perpendicular thick strokes with heads and feet connected by oblique hair-lines—which often look as if they had been dashed in after with a fine pen—all made with an almost mechanical precision (see Plate XVII.).

---

ITALIAN WRITING.—In Italy alone the roundness of the earlier hands was preserved, and though in course of time the letters were affected by the "Gothic" tendency, they never lost the curved forms or acquired the extreme angularity which is seen in the writings of Northern Europe (compare Plates X. and XI.).

At the time of the Renaissance the Italian scribes remodelled their "hands" on the beautiful Italian writing of the eleventh and twelfth centuries (see Plates X. and XVIII., XIX., XX.). The early Italian printers followed after the scribes and modelled their types on these round clear letters. And thus the fifteenth century Italian formal writing became the foundation of the "Roman" small letters, which have superseded all others for the printing of books.
ITALICS.—The Roman Letters, together with the cursive hand of the time, gave rise to "Italic" letters (see fig. 1, & pp. 311, 316, 483).

ORNAMENTAL LETTERS originated in the simple written forms, which were developed for special purposes, and were made larger or written in colour (see Versals, &c., figs. 1, 189).

Their first object was to mark important words, or the beginnings of verses, chapters, or books. As Initial Letters they were much modified and embellished, and so gave rise to the art of Illumination (see pp. 113, 114).

CHAPTER II

ACQUIRING A FORMAL HAND: (1) TOOLS

ACQUIRING A FORMAL HAND: TOOLS, &C.

The simplest way of learning how to make letters is to acquire a fine formal hand. To this end a legible and beautiful writing (see p. 70) should be chosen, and be carefully copied with a properly cut pen.

For learning to write, the following tools and materials are required:—

Desk.
Writing-paper.
Ink and filler.
Pens (Reed and Quill) with "springs."
Pen-knife, sharpening-stone, and cutting-slab.
Magnifying glass.
Two-foot (preferably three-foot) rule, and pencil.
Linen pen-wiper.

THE DESK

An ordinary desk or drawing-board can be used, but the best desk is made by hinging a drawing-board ("Imperial" size) to the edge of a table. The board may be raised and supported at any desired angle by a hinged support, or by a round...
Acquiring a Formal Hand:

(i) Tools

tin set under it (fig. 14). For a more portable desk two drawing-boards may be similarly hinged together and placed on a table (fig. 15).

A tape or string is tightly stretched — horizontally — across the desk to hold the writing-paper (which, as a rule, is not pinned on). The lower part of the writing-paper is held and protected by a piece of stout paper or vellum fixed tightly, with drawing-pins, across and over it (fig. 16). Under the writing-paper there should be a "writing-pad," consisting of one
or two sheets of blotting-paper, or some other suitable substance.¹

It is a good plan to have the lower, front edge of the desk bevelled or rounded, so that the tail part of a deep sheet, which may hang below the table, does not become accidentally creased by being pressed against it. A curved piece of cardboard fixed on the edge will answer the same purpose.

PAPER & INK

For "practice" any smooth—not glazed—paper will do. For careful work a smooth hand-made paper is best (pp. 103, 111).

A good, prepared, liquid (carbon) ink is best. It should be as black as possible, without being too thick. A jet-black ink will test the quality of the writing by "showing up" all the faults; "pale" or "tinted" inks rather conceal the faults, and lend a false appearance of excellence (p. 322). A thin ink greatly adds to the ease of writing (see Addenda, p. 23). Waterproof inks, as a rule, are too thick or gummy, and do not flow freely enough.

The ink-bottle is kept corked when not in use, to keep the ink clean and prevent evaporation. Thick or muddy ink should be put away: it is not worth while trying to use it.

A small brush is used for filling the pen.

PENS

A Reed or Cane pen is best for very large writing—over half an inch in height—and therefore it is

¹ Some Eastern scribes use a "pad" of fur. This, or a piece of springy cloth, or other elastic substance, would probably be helpful, and experiments should be made in this direction.
Acquiring a Formal Hand:

(i) Tools

of great use in studying pen strokes and forms.

A Quill is best for smaller writing, and is used for all ordinary MS. work (pp. 54-60).

The REED\(^1\) pen should be about 8 inches long.

I. One end is cut off obliquely (fig. 17).

II. The soft inside part is shaved away by means of a knife laid flat against it, leaving the hard outer shell (fig. 18).

III. The nib is laid, back up, on the slab (p. 61), and — the knife-blade being vertical — the tip is cut off at right angles to the shaft (fig. 19).

IV. A short longitudinal slit \((a-b)\) is made by

---

\(^{1}\) The ordinary "Reed pen" of the artists' colourman is rather soft and weak for formal writing. The reeds used by the native scribes in India and Egypt, and some of the harder English reeds, are excellent. A fine, hollow cane also makes a very good pen.
inserting the knife-blade in the middle of the tip (fig. 20).

V. A pencil or brush - handle is held under the nib, and is gently twitched upwards to lengthen the slit (fig. 21). An ordinary reed should have a slit about ¾ inch long. A very stiff pen may have in addition a slit on either side of the centre.

The left thumb nail is pressed against the back of the pen—about 1 inch from the tip—to prevent it splitting too far up (see also fig. 27).

VI. The nib is laid, back up, on the slab, and — the knife-blade being vertical—the tip is cut off at an angle of about 70° to the shaft, removing the first rough slit a-b (fig. 22).
VII. A strip of thin metal (very thin tin, or clock spring with the "temper" taken out by heating and slowly cooling) is cut the width of the nib and about 2 inches long. This is folded into a "spring" (fig. 23).

VIII. The spring is inserted into the pen (fig. 24). The loop a b c is "sprung" into place, and holds the spring in the right position. The loop c d, which should be rather flat, holds the ink in the pen. The point d should be about \( \frac{1}{8} \) inch from the end of the nib.

**THE QUILL.**—A *Turkey's Quill* is strong, and suitable for general writing. As supplied by the stationers it consists of a complete wing-feather, about 12 inches long, having the quill part cut for ordinary use. For careful writing it should be re-made thus:

I. The quill should be cut down to 7 or 8 inches (fig. 25); the long feather if left is apt to be in the way.

II. The "barbs" or filaments of the feather are stripped off the shaft (fig. 26).
III. The nib already has a slit usually about \( \frac{1}{4} \) inch long. This is sufficient in a fairly pliant pen; in a very stiff pen (see p. 60) the slit may be lengthened to \( \frac{3}{8} \) inch. This may be done with care by holding a half-nib between the forefinger and

---

Acquiring a Formal Hand:

(i) Tools
Acquiring a Formal Hand: (1) Tools

thumb of each hand, but the safest way is to twitch the slit open (fig. 27), using the end of another pen (or a brush-handle) as explained under Reed, V. (see p. 53).

IV. The sides of the nib are pared till the width across the tip is rather less than the width desired\(^1\) (fig. 28).

\[ \text{shape of ordinary nib.} \]
\[ \text{shape of pared nib.} \]

**Fig. 28.**

V. The nib is laid, back up, on the glass slab, and the extreme tip is cut off obliquely to the slit, the knife blade being slightly sloped, and its edge forming an angle of about 70° with the line of the shaft (fig. 29; for extra sharp nib see fig. 36).

\(^1\) The width of the cut nib corresponds exactly with the width of the thickest stroke which the pen will make in writing.
The shaft rests lightly in the left hand (not gripped and not pressed down on slab at all), and the knife blade is entered with a steady pressure.

If the nib is then not wide enough it may be cut again; if too wide, the sides may be pared down.

Cut very little at a time off the tip of the nib; a heavy cut is apt to force the pen out of shape and spoil the edge of the nib.

VI. The nib should then be examined with the magnifying glass. Hold the pen, back down, over a sheet of white paper, and see that the ends of the two half-nibs are in the same straight line $a-b$ (fig. 30).

The nib should have an oblique chisel-shaped tip, very sharply cut (fig. 31).

A magnifying glass is necessary for examining a fine pen; a coarse pen may be held up against
Acquiring a Formal Hand:

1. Tools

- The light from a window—a finger-tip being held just over the nib to direct the eye (fig. 32).

![Fig. 32.](image)

![Fig. 33.](image)

A nib in which the slit does not quite close may be bent down to bring the two parts together (fig. 33).
Uneven or blunt nibs (fig. 34) must be carefully re-cut.

VII. The Spring (see Reed, VII.) (about \( \frac{3}{4} \) inch by 1\( \frac{1}{2} \) inch) is placed so that the point is about \( \frac{1}{16} \) inch from the end of the nib. The long loop should be made rather flat to hold plenty of ink (A, fig. 35)—neither too much curved (B: this holds only a drop), nor quite flat (C: this draws the ink up and away from the nib).

**OF QUILLS GENERALLY**

For ordinary use the nib may be cut with a fairly steep angle, as shown (magnified) at a, fig. 36.

But it is better for all careful work and fine, sharp writing that the angle be made very sharp: the knife blade is laid back (much flatter than is shown in fig. 29) and the quill is cut quite thin; the knife blade is then held vertical and the extreme tip of the nib is cut off sharp and true (b, fig. 36).

For large writing, the curved inside of the quill is pared flat (c, d, fig. 36)
Acquiring a Formal Hand: 

(i) Tools to give full strokes. If the nib be left curved and hollow underneath (e), it is apt to make hollow strokes.

The pen may be made more pliant by scraping it till it is thinner, or by cutting the "shoulder" (a–b, fig. 29) longer, or stiffer by cutting the nib back until the "shoulder" is short.

Goose and Crow Quills (see p. 172).

The main advantages of a quill over a metal pen are, that the former may be shaped exactly as the writer desires, and be re-cut when it becomes blunt.

A metal pen may be sharpened on an oilstone, but the process takes so much longer that there is no saving in time: it is not easily cut to the exact shape, and it lacks the pleasant elasticity of the quill.

A gold pen is probably the best substitute for a quill, and if it were possible to have a sharp, "chisel-edged" iridium tip on the gold nib, it would be an extremely convenient form of pen. A "fountain pen" might be used with thin ink.

PEN-KNIFE, CUTTING-SLAB, &C.

THE KNIFE.—Quill makers use a special knife. A surgical scalpel makes an excellent pen-knife. The blade should be fairly stout, as the edge of a thin blade is easily damaged. It should be ground only on the right side of the blade and tapered to a point (fig. 37) and be kept very sharp.

FIG. 37.
THE SLAB.—A piece of glass (preferably white) may be used for fine quills; hard wood, one, or celluloid for reed and cane pens.

SHARPENING STONE.—An “India” (coarse) & a “Turkey” (fine) stone. Use thin lubricating oil.

MAGNIFYING GLASS.—A magnifying glass (about 1 inch in diameter) is necessary for examining fine pen nibs to see if they are “true.” A pocket glass is the most suitable for general use, and for the analysis of small writing, &c.

RULE.—A 2, or 3-foot wood rule having brass strips let in to protect the edges, or a metal rule.

LINEN PEN-WIPER.—A piece of an old handkerchief may be used to keep the pen clean.

CHAPTER III

ACQUIRING A FORMAL HAND: (2) METHODS

Position of the Desk—The Writing Level—Use of the Pen—Holding the Pen—Filling the Pen, &c.

POSITION OF THE DESK

Always write at a slope. This enables you to sit up comfortably at your work, and to see the MS. clearly as though it were on an easel—and, by the resulting horizontal position of the pen, the ink is kept under control. It may be seen from ancient pictures that this was the method of the scribes (see Frontispiece). Never write on a flat table; it causes the writer to stoop, the MS. is seen fore-shortened, and the ink flows out of the pen too rapidly.
The slope of the desk may be about, or rather less than, 45° to begin with; as the hand becomes accustomed to it, it may be raised to about 60° (fig. 38).

The "heel" of the right hand may be tired at first, but it soon grows used to the position. A rest for the left arm, if necessary, can be attached to the left side of the board.

**Lighting.** The desk is placed very near to a window, so that a strong light falls on it from the left. Direct sunlight may be cut off by fixing a sheet of thin white paper in the window. *Careful work should be done by daylight.* Work done by artificial light always appears faulty and unsatisfactory when viewed by day.

**The Writing Level**

Each penman will find for himself the *writing level* along which his pen will move most naturally and conveniently (see figs. 39 and 16). The *paper guard* should be pinned on about 1 inch below the writing level: the *tape* is
fixed across about 3 inches above the guard. In the case of very large writing the space between the tape and the guard is greater, and in the case of a very small MS. it is less.

The writing level is kept constant. When one line has been written, the writing paper—which is placed behind the tape and the guard—is pulled up for another line.

USE OF THE PEN

For the practical study of pen-forms use a cane or a reed pen—or a quill cut very broad—giving a broad, firm, thick stroke. It is the chisel edge (p. 57) of the nib which gives the “clean cut” thick and thin strokes and the graduated curved strokes characteristic of good writing (fig. 40).

Therefore, let the nib glide about on the surface with the least possible pressure, making natural pen-strokes the thickness of which is only varied by the different
Acquiring a Formal Hand: 

(2) Methods 

Directions in which the nib moves (see Addenda, p. 23).

It is very important that the nib be cut "sharp," and as often as its edge wears blunt it must be re-sharpened. It is impossible to make "clean cut" strokes with a blunt pen (see Addenda, p. 25).

When the nib is cut back, the "shoulder" should be cut back to preserve the elasticity of the pen (p. 60).

HOLDING THE PEN

THE HAND holds the pen lightly and easily. A good method is to loop the thumb and forefinger over, and slightly gripping, the shaft of the pen, and support the shaft from below with the second finger. The third and fourth fingers are tucked, out of the way, into the palm (figs. 41, 45).

The pen should be so lightly held that the act of writing should draw the edge of the nib into perfect contact with the paper, both the half-nibs touching the surface. (To make sure that the contact is perfect, make experimental thick strokes on a scrap of paper—pinned at the right-hand side of the desk—and see that they are "true," i.e. that they are of even width, with "clean cut" edges and ends.) The writer should be able to feel what the nib is doing. If the pen be gripped stiffly the edge of the nib cannot be felt on the paper; and it will inevitably be forced out of shape and prematurely blunted.

A thin slip of bone—a "folder" or the handle of the pen-knife will do—is commonly held in the left hand to keep the paper flat and steady (see fig. 41).
THE CUSTOMARY MANNER. — The ancient scribe probably held his pen in the manner most convenient to himself; and we, in order to write with freedom, should hold the pen in the way to which, by long use, we have been accus-

Fig. 41.

tomed; provided that, for writing an upright round-hand, the pen be so manipulated and cut as to make fine horizontal thin strokes and clean vertical thick strokes (see fig. 40, & footnote, p. 304).

SLANTED SHAFT, &c.—Most people are accustomed to holding a pen slanted away from the right shoulder. The nib therefore is cut at an
Acquiring a Formal Hand: (2) Methods

Oblique angle\(^1\) to the shaft, so that, while the shaft is slanted, *the edge of the nib is parallel with the horizontal line of the paper*, and will therefore produce a horizontal thin stroke and a vertical thick stroke.

For example: if the shaft is held slanted at an angle of 70° with the horizontal, the nib is cut at an angle of 70° with the shaft (fig. 42). The angle of the nib with the shaft may vary from 90° (at right angles) to about 70°, according to the slant at which the shaft is held (fig. 43).

If the writer prefers an extremely slanted shaft, to cut the nib correspondingly obliquely would weaken it, so it is better to counteract the slant by slightly tilting the paper (fig. 44).

To produce the *horizontal thin stroke*, therefore:

*The slant at which the shaft is held,*
*The angle at which the nib is cut,* and
*The tilt which may be given to the paper:*

---

\(^1\) If the edge of the nib were cut at right angles to the shaft, obviously the horizontal stroke would not be thin, and the true thick and thin strokes would be oblique (see "slanted pen" writing—figs. 9 & 11.)
nust be so adjusted, one to another, that the chisel edge of the nib is parallel to the horizontal line of the paper. Before writing, make trial strokes on a scrap of paper to see that this is so: the vertical thick strokes should be square ended and the full width of the nib, the horizontal strokes as fine as possible.

**HORIZONTAL SHAFT, &c.—The en shaft is held approximately horizontal.** This will

**TILTED PAPER**

Fig. 44.

The desk is shewn here, with a slope of about 45°.

Fig. 45.

be found the natural position for it when the slope
Acquiring a Formal Hand:

(2) Methods

of the desk is about 50° or 60°. It gives complete control of the ink in the pen, which can be made to run faster or slower by slightly elevating or depressing the shaft (fig. 45).

The writing-board may be slightly lowered or raised with the object of elevating or depressing the pen shaft (fig. 46 & p. 118).

The pen makes a considerable angle with the writing surface, so that the ink, which is held in the hollow of the nib, comes in contact with the paper at the very extremity of the nib, making very fine strokes (a, fig. 47).

The spring is adjusted carefully, the tip being approximately 1/16 inch from the tip of the nib. The nearer the spring to the end of the nib, the faster the ink flows. The loop must be kept flattish in order to hold the ink well (see fig. 35).
It is convenient to stand the ink, &,c., beside the desk on the left, and for this purpose a little cup-shaped bracket or clip may be attached to the edge of the writing-board. The filling-brush stands in the ink-bottle (p. 51) or pot of colour (p. 176), and is taken up in the left hand; the pen, retained in the right hand, being brought over to the left to be filled.

The back of the nib is kept dry (a, fig. 48). A very convenient and perfectly clean method, when care is taken, of removing any ink on the back of the pen is to draw it across the back of the left fore-finger.

In careful work the pen should be tried, on a
Acquiring a Formal Hand: (2) Methods

scrap of paper, almost every time it is filled (to see that it is not too full and that the ink is flowing rightly).

The nib is kept clean. A carbon ink (p. 51), through gradual evaporation, is apt to clog the nib (especially in hot weather); therefore every now and then, while the nib is in use, the spring is taken out and the whole thoroughly cleaned. It is impossible to write well with a dirty pen.

CHAPTER IV

ACQUIRING A FORMAL HAND: (3) MODELS

MODELS

The best training is found in the practice of an upright round-hand (p. 302). Having mastered such a writing, the penman can acquire any other hands—sloping or angular—with comparative ease (p. 323).

The English Half-Uncial writing in Plate VII is an excellent model. Those who have sufficient time to spare for the careful study of this, or any other legible and beautiful round-hand, should obtain access to the MSS. in a museum, or procure good facsimiles (see Plates at end of Book, & p. 388).

Those who have not sufficient time for a careful and thorough study of an early MS. will find it
easier to begin with a simplified and modernised writing, such as Script I. (fig. 49).

Modernized Half-Uncial (I.).

Before copying a hand it is well to examine carefully the manuscript from which it is taken: observe its general appearance: note the character and mode of the ruling, and the sizes and relative proportions of page, text, margins, and ornaments. With regard to the actual forms of the letters and the mode of their arrangement, such a method of analysis as the following will be found useful, as an aid to accuracy in copying, and definiteness in self-criticism.
A METHOD OF ANALYSIS.

1. THE WRITING (Ruling)
   general character:
   Double or single lines, &c. (see pp. 304, 305):
   Letters round or angular:
   upright or sloping:
   coupled or separate:

2. THIN STROKES: horizontal or oblique (see figs. 10, 9):

3. THICK STROKES: heavy, medium, or light (see fig. 183):

4. "HEADS" & "FEET": character (see fig. 145):

5. STEMS (ascending short, medium, or & descending): long (see fig. 183):

6. SPACING (Letters, close or wide (see Words, fig. 154): Lines):

7. ARRANGEMENT: in mass (of equal lines), or in column (of unequal lines) (see fig. 154):

8. MEASUREMENTS width of thick stroke (see p. 83): & proportions see pp. 324, 327): height of o and d (see pp. 82, 84): writing lines, distance apart (see p. 82):

9. COMPONENT PARTS: number and forms (see pp. 75, 81, 84):

Example: Analysis of Script I. (as in fig. 50).

Modernised Half-Uncial.
Double lines (see figs. 59, 65).
round.

and so on (see fig. 51).
NOTES ON CONSTRUCTION—SCRIPT I.

The pen generally is held so as to give approximately horizontal thin strokes (see p. 66), but in making \( v, w, x \), parts of \( z, &c. \), it may be "slanted." In figs. 51 and 57 these forms are marked with a small diagonal cross \( X \) (see also p. 25).

Most of the strokes begin as \textit{down-strokes}, but at the end of a \textit{down-stroke}, when the ink is flowing freely, the stroke may be continued in an upward direction (as in \textit{coupling-strokes}, &c., the \textit{feet} of letters, the thin stroke of \( x \), and, if preferred, in making the last stroke of \( g, s, \) and \( y \)).

While the ink is still wet in a \textit{down-stroke}, the nib may be replaced on it and be pushed upward and outward to form the round arch in \( b, h, m, n, p, \) and \( r \). This stroke, reversed, is also used for the top of \( t \) (For making these up-strokes, see fig. 51).

The thin finishing-strokes of \( j \) (fig. 50), & \( F, G, J, N \) (fig. 56), are made with the point of the nib.

\textit{—See Addenda, p. xxiii.}

\textbf{Note.}—The forms \(+oinX\) in fig. 51 contain all the principal strokes in this alphabet, and are therefore useful for early practice.

\textbf{COUPLING THE LETTERS}

These letters are joined together by means of their \textit{coupling-strokes}, which for this purpose may be slightly drawn out, and forward, from the naturally round forms of the letters (see \( c, e, &c., \) fig. 52 & fig. 59).

The \textit{coupling-strokes} are finishing strokes—and as such are akin to \textit{serifs} (p. 244)—growing out of or added to such stems as need "finishing." Coupling enables \textit{beginners} to write faster and with more...

**COUPLING OF LETTERS**

*for reference only: naturally. Shewing how the letters of Script I. join most*

is covered by the first stroke of the succeeding letter. It keeps the individual words more distinct, and 76
therefore permits closer spacing of the text. It should be observed, however, that, excepting the Irish half-
uncial forms where coupling is a characteristic, all the most formal manuscripts are structurally uncoupled (see Plates VIII., X., XXI., & comp. opp. tendency in Plate XII.). The freer and more cursive the hand, the greater is the tendency to join and run letters together, as in ordinary writing.

It is preferable to couple letters below, if possible. Couplings above are sometimes apt to confuse the reading; for example, the cross-bar of t (though the most natural coupling for the scribe to use—see petatis, Plate VII.) should generally be made to pass over or fall short of the succeeding letter (fig. 52).

Spacing: Letters, Words, & Lines

The letters of a word are fitted together so that there is a general effect of evenness. This evenness is only to be attained by practice: it is characteristic of rapid skilful writing, and cannot be produced satisfactorily by any system of measurement while the writer's hand is still slow and uncertain. It is worth noting, however, that the white interspaces vary slightly, while the actual distances between the letters vary considerably, according to whether the adjacent strokes curve (or slant) away or are perpendicular (figs. 53, 152).

It is sufficient for the beginner to take care that two curved letters are made very near each other, and that two straight strokes are spaced well apart.

If the curves are too far apart there will be spots of light, and where several heavy stems are made too close together, "blots" of dark, marring the evenness of the page.

77
Words are kept as close as is compatible with legibility. The average space between two words is less than the width of the letter o (fig. 54).
The Lines in massed writing (see p. 262) are kept close together as is compatible with legibility. The usual distance apart of the writing-lines is about three times the height of the letter o (see also p. 327).

The descending strokes of the upper line must "clear" the ascending strokes of the lower line.

Interlocking of these strokes may be avoided by the experimental placing of p over d (fig. 55).

UNCIAL CAPITALS: SCRIPT II.

These modernised Uncials (see fig. 56, & p. 300) are intended to go with Script I., and their analysis and mode of construction are almost identical with those of Script I. (see pp. 72, 73).

Fig. 57.
Grouping: Uncials have no coupling-strokes; when several are used together, they are not joined, but evenly grouped, allowing as before for curves and straight strokes (see p. 77).

Spacing: (a) When used with Script I., Uncials are written on the same lines, and have to follow the same spacing (in spite of their longer stems).

(b) When Uncials are used by themselves, their spacing may be wider (p. 297).

Note.—The height of Uncial o is about equal to the height of the Half-Uncial d.

NUMERALS & PUNCTUATION MARKS

(See fig. 57.)

These are best made with a “slanted” pen (fig. 9). When writing “Arabic numerals,” 1 and 0 may be made on the line, 2468 ascending, and 3579 descending.

OF COPYING MSS. GENERALLY

When copying a MS. it is best to choose a complete page—or part of a page—to be copied in facsimile.

Two or three lines are copied to begin with; then the composition of the individual letters and words is studied by means of a large pen; and finally the whole page is copied in facsimile. (Of practising, see pp. 85, 86).

Make a general examination and analysis as suggested at p. 71. Accurate measurements will be found helpful.

Take the heights of the o and the d, and the distance apart of the writing-lines with dividers.
The width of the thick stroke is best found by making experimental thick strokes—the full width of the pen nib—on a scrap of paper: cut the paper in half across the thick strokes, and place the cut edge on the thickest strokes in the original MS., you will then find whether the pen nib should be cut wider or narrower.

The direction of the thickest strokes is approximately at right angles to the direction of the thin strokes; which commonly approaches the horizontal in early round hands, and is oblique in other hands (see figs. 9 and 10). The positions both of these strokes in the model, and of your pen, determine the angle of the nib. Therefore, cut the nib across at such an angle to the shaft of the pen that, when you hold the pen naturally, the direction of the thin strokes which it makes on the writing paper will coincide with the direction of the thin strokes in the model; but

(a) The way in which the shaft is held,
(b) The angle at which the nib is cut,
(c) The position of the writing paper,

may all be slightly varied, so that the direction of the thin strokes can be followed exactly (see p. 66).

The writing paper is cut and ruled exactly in accordance with the model; and the heights of the letters and the widths of the thick strokes in the copy agree as nearly as possible with those in the original. It is therefore a good test for accuracy—when a few lines of writing have been copied—to measure and compare their lengths. If they correspond with their originals, it goes far to prove the copy a good one.

Before copying more of the page, the construction of the letters should be carefully studied. The number and the forms of pen-strokes in each letter...
are found by examination—with a magnifying glass if necessary—and by the experimental putting together of strokes, to form a similar letter. For this a large pen, such as a reed, is useful, and it is a good plan to write individual letters and words exactly two, three, or four times their *height* in the model: both the pen nib and the individual letters are made correspondingly two, three, or four times as *wide* as in the original.

It is particularly important, in copying, to preserve accurately the proportion of the *thick stroke* to the *height and width* of a letter (see p. 324). These are conveniently measured by the pen nib itself, or by the estimated width of the thick stroke; thus, in the writing shown in fig. 50, the *width* of the o is approximately *five*, and the *height* approximately *four*, times the width of the thick stroke.

Not only must the copier ascertain what the forms are like and what are their proportions, but he must try to find out *how they were made*. This is of the greatest importance, for the manner of making a letter, or even a single stroke, affects its form and character with a definite tendency (see p. 416 & fig. 172). And this becomes more marked the faster the writing. An apparently right form may yet be wrongly—if slowly—made; but in rapid writing, a wrong manner of handling the pen will inevitably produce wrong forms. As the real virtue of penmanship is attained only when we can write quickly, it is well worth training the hand from the beginning in the proper manner.

Patient and careful examination should be made of the changing pen-strokes, and of the mode in which they join—to form letters—and begin and end—to form “heads” and “feet.” This, accompanied...
by practical experiments in cutting and handling the pen, will bring out details of the utmost technical value. A certain amount of legitimate "faking" (p. 246), play of the pen, and sleight of hand (p. 311), may be found, but, in the main, the regular, natural, thick and thin strokes of the pen, and the orderly arrangement of the writing, give to a manuscript its beauty and character.

Then having cut the nib rightly, you may, in a sense, let the pen do the writing, while you merely follow the strokes of the model, and you will, in course of time, have the pleasure of seeing the same beautiful writing—in the very manner of the ancient scribes—growing under your own hand.

CHAPTER V

ACQUIRING A FORMAL HAND: (4) PRACTICE

PRACTICE

In acquiring a formal writing the penman should have two paper books constantly in hand: one for the study of the forms of letters, the other for both the letters and their arrangement. The first should contain large and very carefully made writing—with perhaps only one word to the line; the second should
Acquiring a Formal Hand:
(4) Practice have smaller and quicker writing, neatly arranged on the pages, with four or five words to the line. (See MS. Books, Chap. VI.) A broad nib is used in preference to a narrow one, so that the characteristics of true pen-work are brought out and the faults made clear. A fine, light handwriting is often very pretty, but it is certain to mislead the novice in penmanship (see p. 324).

Having acquired a formal hand the penman may modify and alter it, taking care that the changes are compatible, and that they do not impair its legibility or beauty. Such letters as are obsolete he replaces by legible forms akin to them in feeling, and, the style of the selected type becoming very naturally and almost unconsciously modified by personal use, he at length attains an appropriate and modern Formal-Handwriting. The process of "forming" a hand requires time and practice: it resembles the passage of "Copy-book" into "Running" hand, familiar to us all (see p. 323).

![Fig. 58.](image)

Having cut the nib of a reed or large quill to the exact width required for the thick stroke, copy the component strokes of the letter α (Script I.), and...
immediately make the complete letter: go through the whole alphabet in this way several times (fig. 58). Next join the letters together (see p. 73) to 87

Acquiring a Formal Hand:

(4) Practice
Acquiring form words—writing always between ruled lines (fig. 59 & p. 414).

Script II. is similarly practised: the letters are grouped (p. 82) to form words (fig. 60).

Next make a neat page of large writing, and, if possible, write such a page every day. The more definite and methodical practice is, the better. "Practising" anyhow, on scraps of paper, does more harm than good.

TO the rational animal the same act is according to nature and according to reason

Fig. 61.

ARRANGING & RULING A SINGLE SHEET

The size of an inscription is commonly settled before the arrangement of the text is planned out, being determined by considerations of its future position and office, or by custom and use (see pp. 100-103 & 351).
The proportions of the writing, spacing, and margins will likewise properly settle themselves (see pp. 265, 103, 107), but where the size of the sheet only is fixed, we have, broadly speaking, to decide between “large” writing with “small” margins (fig. 61), and “small” writing with “large” margins (fig. 62).

Generally a compromise is arrived at and the proportions are more evenly balanced (fig. 63).

Ruling (see also pp. 258, 99).—The mode of ruling marginal lines and writing lines is shown in fig. 65. The ruling should be light, but firm and accurate. A fine pen, or hard pencil, or a blunt point may be used. Where the writing lines are double (as for round hands, p. 304), it is best to have a double ruling point (see fig. 77). Two hard pencils firmly

Fig. 63.

PROBLEM I. (A SHEET OF PROSE)

To write out the Pater noster (50 words) in a formal round-hand (arranged in "mass" of equal lines) on a sheet of "foolscap" (i.e. 17 inches high and 13\frac{1}{2} inches wide).

If the size of the writing be considered of the first importance, a few words are written out in a script chosen to suit the subject, the space, &c., and these are measured to find the area which the whole text so written would occupy (fig. 64). The size of the script is then modified, if necessary, to suit the available area.

90
Fig. 64. Acquiring a Formal Hand: Practice

These 5 words take about 10 sq. inches; therefore the complete 50 words of text will take about 100 sq. ins. (say a space 8½ x 11½ in.)

Fig. 66.
Acquiring a Formal Hand: (4) Practice

Frequently it is desirable first to determine the sizes of the margins. These depend on various considerations of the position and office of the MS., but more particularly on the size of the sheet and the character of its future environment\(^1\) (see p. 351).

The *top* and *side margins* may be of equal width—or the *top* may be a little less (see a, fig. 70). Ample space should be allowed for the *foot margin*, which is generally about twice the width of the *top*, but may vary in different cases, according as the text falls short of or encroaches upon it (see pp. 352, 342). For a plain *foolscap* sheet: *sides* (each) 2\(\frac{1}{2}\) inches, *top* (approx.) 2 inches, and *foot* (approx.) 4 inches may be taken as suitable margins (fig. 65).

The *width of the sheet* (13\(\frac{1}{2}\) inches) less the two *side margins* (2\(\frac{1}{2}\) inches each) gives the *length of the writing lines* (13\(\frac{1}{2}\) — 5 = 8\(\frac{1}{2}\) inches). One or two such lines are written experimentally in a suitable script (say, 5\(\frac{5}{16}\) inch), and the *average number of words per line* (four) is found.

The number of words in the complete text (fifty) will determine the number of lines: an extra line or so may be allowed for safety \(\left(\frac{50}{4} = 12\frac{1}{2}, \text{say} \right)\). The spacing of these is calculated

\[
\begin{align*}
\frac{5}{16} \text{ in. writing requires about } & \frac{2}{3} \text{ in. (close) spacing (p. 79): } \\
\text{Thirteen lines at } & \frac{2}{3} \text{ in. gives } 11\frac{2}{3} \text{ in. = depth of text: } \\
11\frac{2}{3} \text{ in. from } & 17 \text{ in. leaves } 5\frac{5}{6} \text{ in.}^2 \text{ for head and foot margins}
\end{align*}
\]

—and if the space is not sufficient, the writing is

\(^1\) For example, a *framed* sheet does not require such wide margins as a similar sheet *unframed.\(^2\) Really about 6 inches, because the top line of writing will not occupy its full \(\frac{7}{8}\) inch, the unused part of which adds to the top margin (see fig. 65).

94
made a little smaller. If, on the other hand, the marginal depth left over were excessive, the writing might be made a little larger in order to fill up the space.

Problem II. (A Sheet of Poetry)

To write out "He that is down, needs fear no fall," in a formal round-hand on a sheet of foolscap (i.e. 17 inches high × 13½ inches wide).

Here there are three verses of four lines each; these with two space lines, left between the verses, give a total of fourteen lines (fig. 67).

A poem has a given number of lines of various lengths, and only very strong reason or necessity can justify our altering its proper form (e.g. by breaking up the lines) in order to make a mass of equal lines. Such theoretical margins as are possible in the treatment of prose can therefore seldom be observed in writing out a poem, and, unless the height or the width of the sheet can be altered, there is apt to be an excess of margin in one or the other direction. When such excess margin is obviously unavoidable, no objection can be made to its appearance. Poetry may conveniently be treated as "fine writing" (see p. 263).

If the size of the writing be considered of the first importance, several of the longer lines (e.g. the first and the eleventh in the poem given) are written on a piece of paper in the size of writing preferred (say, ¼ inch). By laying this paper on the given sheet, it is seen whether such lines would allow of sufficient side margins. (If they would not, the writing may be made smaller.)

The height of the writing (¼ inch) must allow of the full number of lines (fourteen) being properly
(4) Practice

He that is down, needs fear no foe;
He that is low, no pride:
He that is humble, ever shall
Have God to be his guide.

I am content with what I have
Little be it or much:

And, Lord, contentment still I
Because thou savest such.

Fulness to such a burden is,
That go on pilgrimage:
Here little, and hereafter bliss
Is best from age to age.

Fig. 67.

spaced on the sheet (17 inches) with sufficient head and foot margins. This is calculated—

\[
\frac{1}{4} \text{ in. writing requires approximately } \frac{3}{4} \text{ in. spacing (p. 79)}:
\]

Fourteen lines at \( \frac{3}{4} \) in. gives 10\(\frac{1}{2} \) in. = depth of text:

10\(\frac{1}{2} \) in. from 17 in. leaves 6\(\frac{1}{2} \) in. for head and foot margins.

— and if the space were not sufficient, the lines might be made a little closer, or the writing a little smaller (or, if necessary, the blank lines might be left out between the verses; p. 123).

The Sizes of the Margins.—It will be seen that the above method is primarily for settling a length of line which will allow of sufficient side margins. The process can be reversed; if necessary, the side margins are made of a given width, thus determining the exact length of the line, the size of writing which this line allows being found experimentally.

Note.—The extra long lines may slightly encroach on the right-hand margin: the effect of this is balanced by the falling short of other lines.

**Spacing & Planning Manuscript**

In penmanship great nicety of spacing and arrangement is possible. The ascending and descending strokes may be shortened or drawn out, the spaces between letters and words may be slightly increased or decreased, the lines may be written near or far apart, and the letters may be written with a broader or narrower nib.

Elaborate spacing and planning, however, should not be attempted at first, and straightforward, undesigned work is often the best. The student is apt to waste time writing out an elaborate draft.
in order to ascertain how to space the matter. This is a mistake, because if written well, it is a waste of good writing on a mere draft; if written ill, it is bad practice. The briefer experiments and calculations are, the better, though the simplest problem always requires for its solution a calculation or *process of guess and trial* (such as suggested in the preceding pages). Practice will make people very good *guessers*, and the best work of all is done when the worker guesses rightly, and follows his guesses with the actual work, itself the trial and proof of accuracy.

CHAPTER VI

MANUSCRIPT BOOKS

MS. BOOKS: TOOLS & MATERIALS

*The making of manuscript books*, based on a study of the early MSS., offers the best training to the scribe and illuminator in *writing, lettering, rubricating, gilding, illuminating initials and borders, and miniature painting*, and is the best means of mastering the foundations of Book Typography and Decoration.

*Materials, &c. for MS. Books; Paper* (see pp. 51, 103, 111, 317); *Vellum and Parchment and Pounce* (see pp. 110, 167, 173–5).—Cut a small sheet the

---

1 MS. Books are further considered in Chap. XVI.
ize of a page of the book, and clip the long edge between two flat pieces of wood (holding it as it would be if bound). If the page will bend over and stay down by its own weight, it is thin enough (R) fig. 68); if it stands up (W), it is too stiff.

**Cutting Sheets.**—A frame or template (the size of the sheet desired) is used by parchment makers. It is useful for cutting out the sheets for a common size of parchment book. They are cut on the end-grain of wood, or on card or glass.

**Folding.**—A *Folder*, as used by bookbinders (or bone paper-knife), is useful, and also a *Set or T-Square* for testing right angles, &c. The fold and the top edge of each book-sheet are commonly squared by proper folding.

**Ruling, &c.** (see p. 343).—For marking distances of lines, a carefully prepared paper\(^\text{1}\) scale (p. 25) or pattern & an awl (p. 109), or a “*star-wheel*”—

---

1 The *direct* use of a thick wood or metal scale may lead to inaccuracy.
Manuscript Books

having regular intervals between the spikes—may be used. Or the ruling—of the writing lines—may be simplified by using a stout card frame (internally the size of the text-column) with strips glued across it: for a common size of book this might be made in stout tin or other metal. The lines are commonly ruled with a *ruling stylus* (see figs. 72, 77), or a sort of "rake" may be made to rule six lines at once.

*Writing, Colouring, Gilding, Binding* (Chaps. II., X., IX., XVI.).

**METHODS & PROPORTIONS**

Having to make a manuscript book for a specific purpose, the scribe formulates in his mind a general plan of the work, and decides approximately the respective sizes of page and of writing which seem most suitable.

He endeavours to fashion the book in accord with its use, and therefore allows the (most suitable) material, the subject-matter and the office of the book, and the way in which it will be read and handled, to determine as far as is possible the proportions of its parts, and its treatment as a whole.

Its *material* may be vellum, parchment, or paper, on which a variety of pens, brushes, and other tools with inks, colours, and metal foils, may be employed. Its *office* may be "useful" or "ornamental"; its contents may be long or short, weighty or light, and of greater or less worth; it may be for public or for private use; and the book may be intended to be placed on a lectern, to be held in the hand, or to be carried in a coat pocket.

In following out such natural indications, the
ractised craftsman relies greatly on his working methods, preferring a direct mode of treatment to one which is too ingenious or subtle. In deciding doubtful point, a common-sense of proportion is sufficient guide, and one may generally assume that great works are best "writ large," and that large letters read best on an ample page, and vice versa.

The main proportions which have to be considered are interdependent, and follow one another in their natural order (see p. 256), thus—

1. The size and shape of the book.
2. The widths of the margins.
3. The size of the writing, &c.

And the methodical scribe makes his books of certain definite and regular sizes, each size having corresponding and regular proportions of margins and writing. Though these may greatly depend on individual taste and experience, it is suggested that—like all good designs—they should be allowed as far as possible to settle and arrange themselves.

THE SIZE & SHAPE OF THE BOOK

A book is thought of by the scribe chiefly as an open book, and the width and height of its pages are chosen with a view to its convenient shape and pleasant appearance when open. The most economical sizes into which a suitable sheet of paper can be folded (or a skin of parchment can be cut) may commonly be allowed to decide these proportions.

When a printer is about to print a book he chooses a sheet of paper which will fold into a suitable shape and size. If the sheet be folded once to form two
leaves, the book is called a folio (fig. 69); folded again to form a "section" of four leaves—a quarto (4to);

or folded a third time to form a section of eight leaves—an octavo (8vo). The book is made up of a

---

1 The two, four, eight (or more) pages are printed on both sides of the sheet before it is folded. Two or more sheets are generally folded and put together to form a folio "section."
The penman will find that, besides saving time and labour, it conduces to good work if he keep to certain regular sizes for "large," "medium," and "small" books; and, if the ordinary sheets of paper which he uses will fold in convenient folio, quarto, and octavo sizes, it is well that he make these his standards for paper books.

Paper being made in sheets of various dimensions, by folding a large or a small sheet, a "large" or "small" folio—4to, 8vo—can be obtained.

It may be noted that the length and the width of sheets of paper¹ are very commonly about as 9 is to 7. And therefore, when the sheet is folded for folio or octavo, the proportions are roughly about 7:4½, which are very good proportions for a page of a book. It is obvious that a narrow ("upright") book is easier to handle and more pleasant in appearance (when open) than an album or "oblong" shape of book (b and c, fig. 70).

THE WIDTHS OF THE MARGINS

Margins are necessary in order to isolate and frame a text: thus they contribute to its legibility and beauty. It is better that they be wide rather than narrow (see p. 106, & Note, p. 265); but excessively wide margins are often neither convenient nor pleasing (see p. 222).

The "page" or column of text should be in such proportion to the page of the book, and be placed on it in such a way as to leave adequate

¹ Such as Foolscap (17" × 13½"), Crown (20" × 15"), Demy (22½" × 17½"), Royal (25" × 20"), &c.
Manuscript margins on every side. A narrow column of text is generally best, for short lines are easiest to write and to read, and do not tire the hand, or the eye, in passing from one line to the next. For this reason the text is often divided into two or more columns when the page is wide, or the writing is very small in comparison.

The exact proportion of margin to text in a given page depends on circumstances, and is largely a matter of taste (ex. fig. 71 & note 2, b, p. 256). But just as it is advantageous generally to keep to certain
Fig. 71.—Diagram showing the ruling of a (Recto) page 4¾ inches × 7¼ inches as for a manuscript book (allowing five or six words to the Writing-line). There are fifteen Writing-lines, the Line-space being ⅛ inch.

The proportions of large CAPITALS, shown above, are set by the Line-space (footnote, p. 221).

The Foot margin is 1½ inch.
Manuscript sizes of pages, it is well to keep to certain—corresponding—sizes of margins for regular use.

The proportions of the margins to each other follow a sort of tradition (see fig. 70), the foot margin (4) usually being twice as wide as that at the top (2), the side margins generally greater than the top and less than the foot. The two pages of an opening may be viewed as one sheet having two columns of text; and the two inner margins, which combine to form an interspace, are therefore made narrow (about 1½ each), so that together they are about equal to one side margin (fig. 70). These proportions \((1\frac{1}{2} : 2 : 3 : 4)\) approximate to the proportions common in early MSS.

Sufficient and proportional margins add greatly to the usefulness and beauty of a book. That the writers and illuminators used them when books were read and valued in a way we can scarcely realise now, shows that such things are not, as some might suppose, a matter of affectation. Besides the natural fitness of the common proportions commends them: a deep foot margin is a foundation to the whole, and gives a spare piece for the reader to hold,\(^1\) and wide side margins rest the eyes and keep the text from "running off the page" at the end of each line; and (the two) narrow inner margins combine to separate the pages sufficiently, but not too far, so that they form two "columns" together, framed by the outer margins of the open book.

When books are meant to be bound, from ¼ inch to ½ inch extra margin should be allowed all round the page for the cutting down and binding. The

---

\(^1\) In Oriental books, which are sometimes held by their top margins, the top is deepest.

106
inding is apt to encroach on the inner margins, specially in vellum books, which do not open fully; in order, therefore, that the inner margins may keep their proper width, an extra width of \(\frac{1}{8}\) to \(\frac{1}{4}\) inch (according to the stiffness of the material) is allowed.

**THE SIZE OF THE WRITING, &C.**

The shape, size, and margins of the page (already settled) together determine the length of the writing-line (see fig. 71); and the size of the writing should be such as will allow a reasonable number of words to that line.\(^1\)

Eight or nine words to the line is a common proportion in ordinary printed books, and may be taken by the scribe as his ordinary *maximum*. Lines having very many words are difficult to read.

On the other hand, lines of only two or three words each are generally tiresome, though they may be allowed in special cases of *fine writing* (see p. 262), where it is less necessary to economise space or time, and the effect of an even mass is not desired. But in any case where there is an attempt to make the right-hand edge of the text approximately even, at least four or five words to the line are necessary; the scribe may therefore take four words per line as his ordinary *minimum*.

We may say generally, then, that an ordinary manuscript book should contain between four and eight words (or between 25 and 50 letter-spaces) to the line.

\(^1\) If the average number of words be previously fixed—as in a poem (see p. 95)—that will practically determine the size of the writing.
The exact size of the writing allowed in a given case may be found by a process of guess and trial, but this is seldom necessary for the practical scribe who uses regular sizes for regular occasions.

The line spacing.—The size of the letter determines approximately the distance apart of the writing-lines (see pp. 79, 327). Much depends on whether the ascending and descending letters are long or short (see fig. 154).

The number of writing-lines to the page equals the number of times that the line-space is contained in the text-column (i.e. the height of the page less the top and foot margins)—allowing for the top line not requiring a full space (see fig. 71). Any fractional space left over may be added to the foot margin, or, if nearly equal to one line-space, a little may be taken from the margins to complete it.

The Large Capitals are commonly one, two, or more of the line-spaces in height (fig. 71, & p. 128).

RULING

Having folded and cut the large sheet of paper into small (book) sheets of the size determined on, take one of these as a pattern and rule it throughout as if it were to be used in the book.

The ruling stylus has a blunt point, which indents the paper, but does not scratch it. A stout pin bent to a claw shape and held in a piece of wood does very well (fig. 72).
Under the writing paper there should be a "pad" of ordinary paper (or blotting paper).

The marginal lines are ruled from head to foot of each leaf (a, fig. 73). Besides being a guide for the writing, they give an appearance of straightness and strength to the written page.\(^1\)

![Fig. 73.](image)

The writing lines are ruled across, between the marginal lines, their places having been indicated by equidistant dots (b, fig. 73).

A dozen or more of the small sheets of the book are piled together on a board with their top edges exactly coinciding, and the pattern sheet is accurately placed on the top of the pile. The pile of sheets may be fixed by a narrow piece of wood placed across and screwed down (fig. 74). (See Addenda, p. 25.)

The writing line dots are

\(^1\) They are often ruled double (see p. 343), and sometimes the top and foot lines are ruled from edge to edge of the sheet.
Manuscript Books pricked through all the sheets by means of a fine awl or needle set in a wooden handle (fig. 75).

See also methods of ruling WITHOUT PRICKING, pp. 99—100.

Fig. 75.

The writing lines are ruled as in fig. 76 (sometimes across the narrow inner margins).

For double writing lines a double-ruling stylus may be made of two pins fixed in a wooden handle at the exact width of the writing gauge (fig. 77).

Fig. 76.

Fig. 77.

MS. BOOKS—GENERAL REMARKS

Sections (p. 102).—A section, or "gathering," commonly consists of four book-sheets, folded in half into eight leaves (i.e. sixteen pages), but three or even two sheets are sufficient when they are extra thick, and five or six may be used when extra thin. Parchment sheets should have their smooth sides so placed together that each "opening" of the book has both its pages rough or both smooth and the pages are pounced after they are ruled (see p. 174).

Before the writing is begun the pages of the
section are numbered on the inner marginal line, about \( \frac{1}{2} \) inch or so below the footline. This will prevent mistakes.

*Fly-leaves.*—One or more leaves of the first and last sections in a book are left blank (besides the extra sheet or section (p. 346) which is used in the binding—attached to the cover). A book of any size or importance ought to have at least three fly-leaves at the beginning, and three or four at the end. These extra leaves protect the manuscript, and, in a sense, constitute *margins* for the whole body of the text. They may also be used to make thin books thicker, for the sake of the binding. At the end of Service books, or other books likely to be of permanent interest, additional fly-leaves should be provided for notes and annotations (see pp. 344, 346).

*Rough or Smooth Edges.*—The rough "Deckle" edges of hand-made paper are inconvenient in a book of any thickness, and should be trimmed off after folding, though they may be left in the case of very thin books. The deckle edge should not occur at the top of the page, as it would there be a trap for dust, and because it is important that the tops of pages should all be level. The top edge or head of a book is often cut and gilt in order to keep out the dust—this is called "Library gilt." It is more suitable, however, that *all* the edges be gilt.

*The Top Margins* throughout the book are kept quite level. Any irregularity at the top of a page catches the eye at once, while slight differences at the side, or considerable differences at the foot, may occur without spoiling the appearance of the margins. All measurements for marginal and writing lines, &c., are therefore made from the *fold* of the
Manuscript book-sheet and from the top edge, which is cut at right angles to the fold.

Regular Writing.—In writing one page it is a good plan to have its fellow page, or a similarly written one, fixed on the desk beside it as a pattern. This will save the beginner from a very common error—writing larger or smaller (which of course spoils the look of the pages).

Initial Page.—The text of a book commonly begins on a recto, or right hand, page (see p. 365).

CHAPTER VII

VERSAL LETTERS & COLOURED CAPITALS

Development of Versals—General Analysis of Versals—Notes on Construction of Versals—Spacing & Arrangement of Versals.

DEVELOPMENT OF VERSALS

The earliest books consisted of a number of lines of continuous writing in capital letters. There were seldom any divisions of the text—into paragraphs, chapters, or the like—or even of one word from another; nor were important words distinguished by larger initials. The first division of paragraphs was made by a slight break in the text and a mark; later, the first letter of the first complete line of the new paragraph was placed in the margin and written larger. When "small-letters" were evolved, capitals ceased to be used for the body of the text, and became distinguishing letters for headings and important words.
The capitals written at the beginnings of books, chapters, and paragraphs grew larger and more ornamental, and at length were made in colour and decorated with pen flourishes. Such letters, used to mark the beginnings of verses, paragraphs, &c., have been called "Versals." ¹

In modern printing and ordinary writing the first line of a paragraph is generally indented (a, fig. 78), but the earlier method of employing a special mark or letter (b or c) is more effective, and it might very well be used, even in modern printed books, for fine editions. Affording a legitimate opening for illumination and book-ornament, it was (and is) the natural method for the penman, who, starting with these useful capitals, by flourishing them—in their

¹ Though Versals may generally be regarded as paragraph marking letters, it is convenient to apply the term to the Versal type of letter (the early Illuminator's Pen-capital)—e.g. "a heading in Versal letters" (see fig. 91).
own colour, or by dotting, outlining, or ornamenting them, with a contrasting colour (see fig. 79, from an old MS.), evolved the Illuminated Initial.

Types of Versal Letters (examples: Plates IX., X., XI., XII., and figs. 1, 78 to 94, 150, 161, 165, 166, 189). — The earlier Versals had very simple and beautiful pen shapes, and are the best models for the modern penman to follow. After the fourteenth century they were often fattened and vulgarised and overdone with ornament. In this way they not only lost their typical forms; but their "essential forms" — as letters derived from the Roman Alphabet — became much disguised and confounded (see fig. 128).
GENERAL ANALYSIS OF VERSALS

1. THE LETTERS: (Pen-made, Built-up, Ornamental (coloured), Roman Capitals with a “Gothic” character (Round and Square forms).

2. HORIZONTALS—
   STRAIGHT: Medium—commonly the width of the nib.
   CURVED: Thin—the thin stroke of the pen.

3. PERPENDICULARS: Built-up, slightly curved in on either side.

4. SERIFS: Thin, short or long, tend to curve.

5. LONG STEMS: Various (see p. 119, & figs. 84, 90).

6. SPACING—
   Letters & Words: Various (see figs. 89, 92, 166).
   Lines: Usually one or more of the line-spaces apart (see pp. 126, 128).

7. ARRANGEMENT:
   Singly: set in text or margin, or part in both (fig. 86).
   Grouped: after large initials (fig. 92).
   In Lines: wide or close, often one word to the line (fig. 89).

8. MEASUREMENTS:
   Stem width: commonly two or three widths-of-nib across thinnest part (fig. 165).
   O height: commonly one, two, or more of the line-spaces.

9. COMPONENT PARTS: A has approx. 10 strokes & filling.
   B 8
   C 7
   and so on (see fig. 81).

Fig. 81.
**NOTES ON CONSTRUCTION OF VERSALS**

*(See figs. 80, 81, 85, 165)*

Versal Letters are properly built-up (p. 291) with true pen-strokes (*b*, fig. 81). Drawn or painted, they acquire a different character (p. 292). Their office being to mark important parts of the text, they are generally distinguished by colour and freedom of form—tending to curves and flourishes.

The pen has an extra long slit (½ inch to ¾ inch), and the *writing-board* may be lowered (see fig. 46, *b*) to permit of the thick, liquid colour running out freely. The nib is of the ordinary shape (but not too oblique), and generally rather less in width than the nib used for the accompanying text (*a*, fig. 81).

The outlining strokes are quickly written and immediately filled in, each letter being loaded well with the colour, which thereafter dries evenly, with a slightly raised "flat" surface. The liquid colour should be fairly thick (see *colour*, p. 176).

"Gothic lettering" is a term used for "Black-letter" and related types, as distinguished from "Roman" types. "Gothic" capitals tend to roundness, the small-letters to angularity, but in each the abrupt change from thick to thin strokes, and the resulting contrast of stroke, are characteristics—the outcome of pen work.\(^1\) Versals, though primarily Roman letters,\(^2\) have this contrast strongly marked; *the ends of the thinner strokes spread* (see p. 25), *and the heavy parts are crossed by thin serifs*.

The early Versals approaching the "Roman

---

\(^1\) The pen, in direct proportion to the breadth of the nib, tends to give a "Gothic" character to all letter forms.

\(^2\) See Plate 5 in "Manuscript & Inscription Letters,"
Letter” (p. 294) make excellent models, the later ornate “Lombardic” type (p. 34) is not so safe. Versals are capable of great variety, and the “round” or “square” D, E, H, M, and W may be used at pleasure.

The Stems curve in slightly on either side. When they are very tall the mid part may be quite straight, imperceptibly curving out towards the ends (b, fig. 82). This gives an effect of curvature throughout the length, while keeping the letter graceful and straight. The head of a stem (especially of an ascender) may with advantage be made slightly wider than the foot (fig. 83). This applies generally to all kinds of built-up capitals.

The stem width may be nearly the same in Versals of different heights (a, fig. 84): generally the letters tend to become more slender in proportion as the letters grow taller (b). Very large Versals (or initials) are often made with a hollow stem to avoid a heavy appearance (L, fig. 84).
The Serifs are long and slightly curved in ornamental forms (fig. 79): shorter, and nearly straight in stiffer forms (fig. 166). In many cases the serifs appear to have been written first, the stems being added between them (f, fig. 81)—in old MSS. the stems often show ragged ends crossing the serifs. Sometimes the serif appears to have been added to the stem in two pieces, half on either side springing from the corners of the stem (g). The safest way seems to be the complete finishing stroke added to, and forming sharp angles with, the stem (h).

Arms or Branches.—Width of nib at start, and built-up at free end. (Pen horizontal, figs. 81, 165).
The Bows or Curves of Versals (and of built-up letters generally) are best begun with the inside stroke.

Construction of "bows" (a.)

Normal flat curve (b.)

(C) Fig. 85. Another method (c.)

A way of making D P & Q

(a) Flat curve: and finished with the outerroke—a pronounced curve (a, fig. 85). This
preserves the continuity of the interior curve, together with the clean contrast of the thick and thin strokes (see inside shapes, p. 253). The normal form may be flattened or curved a little \((b)\), but exaggeration in either direction produces a degraded form. Part round letters, as \(D, P,\) and \(Q,\) may be begun with a complete inner oval, or a nearly completed \(O\) (to which the stem is added); this preserves their interior symmetry \((c)\).

The beauty and quality of Versal letters depends very much on their freedom; touching-up or trimming after they are made is apt to spoil them; and when good letters are made with a free hand, minute roughnesses, which are due to their quick construction, may be regarded as shewing a good rather than a bad form of care-less workmanship (see \((c)\) fig. 164).

**SPACING & ARRANGEMENT OF VERSALS**

(Allowing for the special treatment of Versals called for by the extreme freedom and elasticity of their pen forms, the following remarks apply generally to the spacing and arrangement of coloured capitals in written pages.)

*Versals accompanying Small Text* are generally dropped below the writing-line, so that their tops are level with the tops of the small letters (fig. 86).

*Sizes of Versals.*—Letters which are of the same importance—*i.e.* serve the same purpose—are usually of like size and form throughout; and the more important a letter, the more it tends to be elaborated and decorated (see figs. 90, 92).

*Special words in Text marked by Versals.*—Where coloured capitals are used throughout the text (fig. 92), the colours are usually varied (pp. 134, 185).
Line beginnings marked by Versals.—Where every one of a page begins with a coloured capital, the majority of the forms are kept rather plain (see (5) p. 136). They may be effectively treated as a band of simple or variegated colour (p. 136). This is a common treatment for a list of names or a poem; sometimes, especially if there are many lines, simple-written capitals (p. 297) may be used instead of Versals.

Verses or Paragraphs may be marked by Versals in the text (a), or part in margin, part in text (b), or wholly in the margin (c, fig. 86). The marginal capital is the simplest, and it has the advantage of leaving the page of text entire; it may, however, sometimes be desirable to break the continuity by an inset capital, especially in cases of closely written text, or of stanzas not spaced apart (see p. 138).

The first word of a paragraph, which is begun with a Versal, is often completed in simple-written capitals of the same colour as the text (a, fig. 86).

Various ways of marking Paragraphs.—(a) The paragraph marks ||, ||, preferably coloured, may be used instead of (or even with) Versals (comp. fig. 95); (b) by one word or line (or several words or lines) of simple-written (or built-up) capitals in black or colour (see fig. 93); (c) by some suitable ornament (see fig. 87); (d) in many cases it is well to have spaces between the paragraphs or verses (see p. 138).

Line-Finishings at the ends of Verses, &c. (pp. 205, 425), may be made with the Versal pens and colours.
Versals set in the text—

ESPECIALLY when versals are large:
say three line-spaces or more in height.

a. Versals set partly in text:
paragraphs beginning with tailed letters,
such as ADHJKLP &c.
are conveniently treated in this manner—

b. Versals in margin:
often used when the versals are small:
suitable for comparatively small or
numerous capitals.

c.

Fig. 86.
the end of one paragraph. THE NEXT PARAGRAPH may be marked by a line—of written capitals in black or colour (on or below line)(a.)

Or a band of suitable (usually pen-made) ornament may be interposed(b.)

Fig. 87.

To mark Chapters (or even Books), extra large Versals (fig. 88) may be used, in lieu of more elaborate initials. Smaller Versals may be grouped round about, beside or inside initials (p. 208 & fig. 92).

Headings and Pages in Capitals (see also pp. 128, 132).—Each line of capitals is generally kept uniform throughout its length, though different lines vary in size and colour (see fig. 89). If it be possible it is well to keep the individual word entire and to

---

1 The mediaeval scribes often made the first line of a chapter or book in uniform capitals (excepting the initial letter). The succeeding line generally was smaller, and of a different colour and type—even when a divided word was carried over into it.
let the heading or page contain the complete initial phrase or sentence (see fig. 91).

Generally the greater the number of capitals the plainer their forms are kept, and the closer their spacing. It is best to keep to the regular method of spacing the lines of Versals one of the writing-line spaces (or more) apart—though in special cases the Versals may be independent of the writing-lines.

BEGINNINGS of books are marked by an initial letter. A large versal—three or more line-spaces high is quite effective & simple.

Fig. 88.

Spacing Out.—Coloured letters and ornaments are usually put in after the plain MS. has been written. A very little practice enables the scribe accurately to guess the amount of space which he should leave for the Versals, &c., whether it is designed to have several lines of them, or a single letter only on the page. A few pencil marks may be used to settle a doubtful point, but an elaborate sketching or setting out in pencil spoils the freedom of the work.
CHAPTER VIII

BLACK & RED

Rubricating—Initial Pages or Title Pages—Prefaces & Notes in Colour—Pages with Coloured Headings—Page or Column Heading & Initial—Versals in Column or Marginal Bands—Stanzas or Verses marked by Versals—Music with Red Staves—Tail-Pieces, Colophons, &c.—Rubricating: General Remarks.

RUBRICATING

Red, either in the form of a pigment or fluid ink, is of very ancient and common use. It is seen on the early Egyptian pyri; and it appears in the earliest extant vellum MSS., either in titles or the first lines of columns or chapters. The Greek term was μελάνιον κόκκινον; Latin minium,¹ brica.”—(Thompson’s “G. & L. Palæography,” p. 51.)

Rubricating, or the adding of Red, or other coloured, letters, line-finishing, or signs, to a MS. or Book, in which the main body of the text is already completed black, constitutes in itself a very useful and effective form of decoration. It is, moreover, a connecting link between plain writing and illumination proper; and we may safely assume that the artists who made the beautiful illuminations of the Middle Ages were trained as scribes and rubricators.

INITIAL PAGES OR TITLE PAGES

Fig. 89 represents an Initial Page in Red Capitals. The same arrangement may of course be used with variety of colours and with gold: see Note (4)

¹ Minium = red-lead, used in early times for “rubrics” and drawings, hence is derived the word “Miniature.”
Title Pages came into fashion after printing was introduced. Early MSS. commonly began with the opening words written in large, decorated capitals; the title sometimes being written quite small, near the top of the page: other details were commonly put in the colophon in early books (see p. 142).

When the title is more important, in a literary sense, than the opening sentence, it may be well to follow the modern fashion. But when there is a finely worded opening sentence—perhaps the keynote to the rest of the text—while the title is merely for reference, it seems reasonable to magnify and illuminate the actual beginning of the book rather than the mere name of it (see p. 365).

Note (i).—In fig. 89 the title—(IHS CHRISTI) Evangelium Secundum Ioannem—written in as a decoration of the initial word; the old form "IHV XPI" is used for "Jesu Christi" (these letters, it will be noticed, are here employed to lighten the large capitals, see p. 208).

(2) Where IN is an initial word, to enforce the narrow initial I, both letters may be magnified.

(3) The scale of the lettering corresponds with that of the ruled lines (these do not show in the figure): the letters and the interlinear spaces are each one line high; the initial word is four lines high. Such a mode of spacing is very simple and effective and will save the rubricator much unnecessary trouble and fruitless planning (see footnote, p. 221).

(4) Other Colour Schemes.—All Burnished Gold (or with Title in red); or IN gold, with small capitals Red (or in Blue and Red lines alternately—Blue, Red, Green, Red: see p. 181).
Fig. 90 represents a preface, or note, written in red.

It was a frequent practice in old MSS., where there were prefaces, or prologues, or notes—not actually part of the text—to keep these distinct by writing them in red. A somewhat similar usage still exists in modern typography, where such parts are sometimes distinguished by Italic type (see p. 315).

The distinction of a preface, "rubric," or note from the main body of the text makes a book more readable, and, as a page of red (or blue) writing is very pleasant and effective, we may certainly take advantage of such a reasonable excuse for introducing it. Entire books have been written in red, but this is a questionable mode, as too much red text would tire the eye.

Note (1).—The writing is founded on the tenth-century English hand given in Plate VIII.

(2) The flourishes on s and e fill gaps at the ends of the lines, and the spread out AMEN fills the last line.

(3) The Headline is in simple written capitals.

(4) The effect of colour contrast of the built-up Ps with the simple writing: the solid Ps (though really the same colour) appear to be a much deeper red than the writing, which is lightened by the intermingled white of the paper.

(5) Other Colour Schemes.—The Versals (Pr) in burnished gold; the rest in red or blue.
PATER NOSTER
qui es in coelis? sanctificetur nomen tuum. Adveniat reg
num tuum. Fiat vol-
luntas tua, sicut in

nostris. Et ne nos in
ducas in tentation-
em. Sed libera nos a
malo. A M E N

FIG. 92.
Fig. 91 represents the first page of a chapter (or a book) with a **Heading** in red capitals.

It is convenient in practice clearly to distinguish between the two modes of beginning—

(a) with an illuminated Initial-Page (see fig. 89), or,

(b) with an illuminated Heading (see fig. 91).

The former may be treated as though it were a decoration to the **whole** book. The latter is intended more particularly to decorate its own page.

The **Heading** should therefore be proportionate to the body of the text below it. About **one-third** Heading and two-thirds text make a good proportion. A “**Heading**” occupying half, or more than half, of the page is apt to look disproportionate, and it would be preferable to this to have a complete, or nearly complete, 1 **Page** of coloured capitals.

**Note (1).**—The full effect of black and red is obtained by an arrangement of the two colours in marked contrast.

(2) The lines are used as a scale for the **Heading**, the red capitals and interspaces each being one line high. If a **Heading** so spaced appear too close to the first line of black writing, another line space may be left.

(3) The round Es are used to fill out the second line, and the square, narrow E to relieve the crowded third line.

(4) **Other Colour Schemes.**—The entire **heading** or the letters W, H, B, O, R, in burnished gold or the whole variegated (see p. 180).

---

1 An illuminated **Page** will allow of a few lines of black text at the foot (an arrangement very common in the elaborate Initial Pages of the fifteenth century), but these should be quite subordinate to the “Illumination.”
WHO HATH BELIEVED OUR REPORT

and to whom hath the arm of the Lord been revealed? For he grew up before him as a tender plant, & as a root out of a dry ground: he hath no form nor comeliness; & when we see him, there is no beauty that we should desire him. He was despised, & rejected of men; a man of sorrows, & acquainted with grief: & as one from whom men hide their face he was despised, & we esteemed him not.

FIG. 91.
Fig. 92 represents the first page of a book or chapter in two columns, beginning with a rather ornate Heading, in which the Initial is made the principal feature, and having coloured Versals and line-finishings throughout the text.

It is more difficult to get a good effect in this way than by means of a marked colour contrast (see p. 144), or variegated colour, and gold (see Note 7).

Note (1).—The lines bounding the text would naturally be indented, or pale (not black as in the block), and ruled from head to foot of the page (see Note (2) on the next figure).

(2) The red ornamental line-finishings (see p. 205) would be more effective if variegated.

(3) The Versals in the text are made about a line high, but are dropped below the line (p. 122).

(4) The Versals in the Heading are made one line high, with one-line spacing—between O and D increased to two lines (partly filled by a flourish from the D), in order to fit the U, O, and D in evenly beside the Initial.

(5) The Initial Q should project slightly up and out—beyond the bounding lines—to mark the top, left corner more strongly (see footnote, p. 211).

(6) All the rubricating on this page is done with the same pen (see pp. 205, 218).

(7) Other Colour Schemes. "QUOD FUIT AB INITIO," the filigree ornament and the V V in burnished gold (or the Q and VV in gold), the rest of the Versals and line-finishings in Red and Blue, or Red and Green, or Red, Blue, and Green (see pp. 181, 185).

em non facimus.

FIG. 92.
VERSALS IN COLUMN OR MARGINAL BANDS

Fig. 93 represents two columns of black text, consisting of short verses, &c., which are marked by coloured capitals—forming bands of colour—in the margins.

Note (1).—The coloured capitals in the figure are made rather larger than usual, to enforce the effect of the two lines of red and mark their contrast with the columns of black text. In practice, however, they would be better and more distinct if rather smaller.

(2) The lines bounding the text would naturally be faint, or grooved (p. 343); but, ruled from head to foot of the page, they would be sufficiently apparent to add materially to the general effect of orderly arrangement. (Lines are printed here to show clearly the way the two columns are ruled and to suggest this effect, though the process block necessarily gives a false impression in making them appear too short and too heavy).

(3) Extra width between the columns (and also in the margin) may be allowed for the coloured capitals (compare fig. 92).

(4) Words in simple written capitals are used to mark slight divisions, or changes of sense, in the text.

(5) A stiff Versal of a rather “Roman” type is used, partly because of the number of the capitals (see p. 126).

(6) Other Colour Schemes.—The larger capitals might be in burnished gold, the rest in red (or in red, blue, and green); or all might be in red, blue, and green.
RELY THERE
A MINE FOR
LIVER
D a place for gold
which they refine.
M is taken out
of the earth,
and brass is molten
out of the stone
in setteth an end
darkness,
and searcheth out
the furthest bound
the stones of thick darkness and of the shadow of death.
BREAKETH
a shaft away from where men
journey;
they are forgotten of the foot that
asseth by;
they hang afar from
men, they swing
and so.

A S FOR THE EARTH,
out of it cometh bread:
and underneath it is turned up as it were by fire.
the stones thereof are the place of sapphires,
and it hath dust of gold.
HAT PATH NO BIRD OF PREY KNOWETH,
either hath the falcon's eye seen it:
he proud beasts have not trodden it
or hath the fierce lion passed thereby
E PUTTETH FORTH his hand upon the flinty rock;
E OVERTURNETH the mountains
by the roots.
E CUTTETH out

FIG. 93.
137
Fig. 94 represents a poem in two verses which are distinguished by interspaces and by coloured capitals—a brief introductory line also being in colour. (It is supposed that the poem occurs in a book—mainly in prose—written in Roman small-letters.)

It is generally best to distinguish the verses of poems by one-line interspaces. When this is done, coloured initials are not so necessary, and their value become chiefly decorative (see 123).

Note (1).—The writing is founded on "Italic" (see Plate XXI.), and (it is supposed that) it would be used here wherever the songs occurred; firstly, to distinguish them from the rest of the text, and secondly, to keep the lines of the poem entire—Italics occupying less room than ordinary, round Small-Letters (see p. 315).

(2) The story opens with the first line, which may in this case be regarded either as a Title or as a prefatory note in red.

(3) The two red capitals are made of a rather "Roman" type to match the Italic (and the small Roman text of the book). The difference in height made between the W and the S is intended to balance the difference in width, and to give them an appearance of equal weight. This may be permitted where there are only a few capitals; where there are many, their heights are generally kept more uniform.

(4) Another Colour Scheme.—W and S would look better in burnished gold.
of Aucassin and Nicolete

/ HO would list to the good lay?
G ladness of the captive grey?
T is how two young lovers met,
Aucassin and Nicolete,
Of the pains the Lover bore
And the sorrows he outwore,
For the goodness and the grace,
Of his Love, so fair of face.

S WEET the song, the story sweet,
There is no man hearkens it,
No man living 'neath the sun,
So outwearing, so foredone,
Sick and woful, worn and sad,
But is healed, but is glad
Tis so sweet.

Say they, speak they, tell they the Tale:

Fig. 94.
Fig. 95 is a reproduction, in facsimile, showing quarter of a page of a folio Service Book (probably French, early sixteenth century). The page consists of two columns of ten staves each, and is headed \textit{In vige (lia), nativitatis dni}. The book is printed on vellum in red and black; the columns of music have faint red bounding lines ruled by hand (not shown in the figure).

The red stave is very effective, and it was commonly used in early MSS. and printed books. There appears to be some doubt, however, as to its practical value, and I have been advised that it is not so legible as the black line stave, and also that, in \textit{Church Service Books} (see p. 345), in order to make an absolutely clear distinction, red should be reserved entirely for the \textit{rubrics}.

The “plain-song” chant, with its four-line stave, has a simpler and finer appearance than the more modern and elaborate five-lined stave and tailed notes. The latter, however, may yet be treated very effectively.

\textbf{Note 1.}—The mark \(\square\) and the capitals \(\mathcal{S}, \mathcal{B}\), and \(\mathcal{G}\) were blotted—it can scarcely be called “painted”—with yellow. Yellow or red were often used in this way to mark the small black capitals in printed books (\& in MSS.—especially in the small Bibles of the 13th century—p. 428, \& comp. p. 302). It is a questionable method. (These blots have been removed from the figure—except, by an oversight, in the case of \(\mathcal{S}\)).

(2) \textit{Other Colour Schemes}.—(a) The title, or (b) the text and the notes, might be in burnished gold (the other parts in either case remaining in \textit{red} and \textit{black}).

Fig. 95.
TAIL-PIECES, COLOPHONS, &C.

Fig. 96 represents a coloured Tail-piece or decorative finish at the end of a book (or chapter).

*The Colophon* (see p. 128 & figs. 13, 191), generally distinguished from the text by a smaller or different hand, and—especially in early printed books—by *colour* or other decorative treatment, occurs at the end of a book, where it is the traditional right of the penman and the printer to add a statement or a symbolical device. The *Name* (of craftsman and assistants), *Time*, and *Place* are commonly stated—preferably quite simply—e.g. “This book, written out by me, A.B., in LONDON, was finished on the 31st day of DECEMBER 1900.” Any reasonable matter of interest concerning the *text*, the *materials*, *methods*, *lettering*, or *ornament*, and an account of the *number of leaves and their size*, &c., may be added. But the craftsman, properly and modestly keeping his name off the title-page, is at liberty to exercise his right, marking the end of, and *signing* his work in any way he chooses—even in a speech or a sentiment—provided the form of the colophon be unobtrusive and its language natural. *Printer’s devices* or *book-marks*, consisting of symbols, monograms, &c. (p. 362), were likewise used.

The opportunity generally provided by the final margin, and the natural wish to close the book with a fitting ornament, also led to the use of colour or capitals in the concluding lines; and sometimes the “tail” of the text was given a triangular form, the lines becoming shorter and shorter till they ended in a single word, or even one letter.
But I have not finished the five acts, but only three of them."—Thou sayest well, but in life the three acts are the whole drama; for what shall be a complete drama is determined by him who was once the cause of its composition, and now of its dissolution: but thou art the cause of neither—

Depart then satisfied, for he also who releases thee is satisfied.

Fig. 96.
Rubricating: General Remarks

Contrast of Red and Black.—The most effective arrangement of red lettering with black text involves a sharp contrast, and, as a rule, the concentration of the red in a line or mass (see figs. 91, 93, and 95 where the red lettering is massed at the head, side, and foot of the black). Too many red capitals scattered through a page lose their effect, and appear as though they were brown-red rather than bright red (see pp. 134, 185). Printed title-pages, &c., may be seen with promiscuous lines of black and red, from which the fine effects obtainable by the use of bright colour is dispersed and lost; while the same, or even a less, amount of red, massed in one or two places in the page, would show to great advantage.

Notes in Red in Margins.—Red lettering, or particularly small red writing, may be used freely in the margins; being much lighter than black, appears there as a marginal decoration, not interfering with the regular look of the page. Indeed red may be used more freely, and I think its decorative effect is greater, in the form of rubrics, than any other simple form of ornament (see Red Church Service Books (pp. 140, 345) and Red substituted for Italics (p. 315)).

Paragraph and other Marks.—Various symbols, numerals, and marks (such as † ‡ * † ‡ † ‡ † —Addenda, p. 25) may be made in red.

Red Lines.—Lines made to divide, or outline pages ("rules" or "rule borders") should be sparingly used, and then rather in black than in red (see p. 364). If in red, particularly between lines of writing, these should be "ruled feint" with diluted colour.

144
Red for Ornaments.—Red may be used pretty freely with other colours (blue, green, and gold), but by itself more sparingly.

OTHER COLOURS.—The foregoing remarks refer mainly to contrasts of black and red, but apply, to a certain extent, to black with any bright colour or gold (see "Other Colour Schemes" given above, and p. 180).

CHAPTER IX
LAYING & BURNISHING GOLD

Tools & Materials—Laying the Ground—Laying the Gold-Leaf—Burnishing the Gold—Remedying Faults in Gilding—Gold Writing—Other Methods & Recipes for Gilding—Appendix on Gilding (by Graily Hewitt).

TOOLS & MATERIALS
These should be kept together in a convenient box, as it is important that the process should not be interrupted by a search for a missing tool.

Tools and Materials.

Laying & Burnishing Gold

**Tools and Materials.**

- **SCISSORS.**
- **BURNISHING-SLAB.**
- **BREATHING-TUBE.**
- **RUBBING-PAPER.**
- **CHALK OR SOFT LEAD PENCIL.**
- **BURNISHER, TOOTH SHAPE.**
- **FEATHER (Brush, &c.).**
- **BRUSH.**
- **(HARD INDIARUBBER.)**
- **(POWDER GOLD & FINE BRUSH.)**

**Summary of Process.**

- For cutting gold-leaf.
- For backing the parchment or paper while under pressure.
- For damping size.
- For pressing leaf on to size.
- For marking form on rubbing-paper.
- For (1) pressing down, and (2) burning gold-leaf.
- For dusting off the pounce.
- For brushing off waste leaf.
- (For removing gold from parchment.)
- (For “mending” in certain cases.)

**LAYING THE GROUND**

**Drawing the Form.**—Elaborate letters or ornaments may be drawn with a hard pencil, which will leave slight indentations in the surface of the page when the marks of the lead have been removed with indiarubber. In the case of free lettering or gold writing, however, the forms should be made directly with the pen (see pp. 148, 164).

**Preparing the Surface: Pouncing.**—The surface is thoroughly cleaned and prepared with powdered pumice stone, or other suitable “pounce” (see pp. 167, 174). This being rubbed well into the actual part which is to take the size absorbs grease and slightly roughens the surface. The surrounding parts are also pounced to prevent the gold-leaf from sticking to them later.

**Composition of the Ground or Size.** The chief

1 The surface of horny or greasy parchment may be slightly roughened with a pen-knife till little hairs are raised which will hold the size, care being taken that this roughening does not extend beyond the actual parts which are to be covered with size. (Oxgall: see footnote, p. 175.)

146
Substance in a “size” or raising preparation is generally some kind of earthy matter, to give it body—such as chalk, Armenian bole, slaked plaster of Paris (this is very good: see p. 166). Other substances, having toughness and stickiness (such as glue and gelatin, and sugar, treacle and honey) are used to bind the earthy matter and prevent its breaking when the page is turned over or bent, and also to make the size adhere to the page and the gold-leaf stick to the size. Yellow or red colouring matter is often added. A preservative, such as oil of cloves—in a minute quantity—may be present: this will permit of the size being kept in a semi-liquid condition, in a closed jar.

Mixing the Size with Water.—The size, if kept semi-liquid, must be stirred very carefully and well, and a little taken out of the jar is rubbed down in a saucer—great care being taken to avoid making bubbles. The right consistency is judged by experience—it should be thick rather than thin, but it should be thin enough to flow easily.

It is essential that all the ingredients be present in their right proportions, and the mixture should be stirred every now and then. Otherwise the earthy

---

1 Good results have been obtained from a mixture consisting approximately of Slaked Plaster of Paris 10 + Whitelead 3 + Fish-lure 3 + Treacle 1 :—by weight.

Another recipe (given to me by Mr. G. Loumyer) is:—

“Chalk (Whiting),
Oxide of Iron—\(\frac{1}{3}\) grain.
Glue (Carpenter’s)—4 grains.
Gum Arabic—2 grains.
Water—50 grains.

Melt the gum and the glue together in the water, then add the oxide of iron, and lastly put in enough chalk to make the whole a rather liquid paste. Apply to the parchment, which you have previously well rubbed with whiting, and, when dry, apply the gold-leaf with alcohol.”

147
matter settles down, and the sticky parts, remaining in solution above, are liable to be used up. What is left in the saucer after use is apt to be deficient in its sticky parts, and it is best thrown away. Take out of the jar only what is required at the time, and mix a fresh lot the next time.

Bubbles, formed in the mixture, may be burst by a needle, or by adding a minute drop of oil of cloves.

Methods of Laying the Size.—The parchment or paper is laid flat on a table; if on a slope, the size would run down and lie unevenly. A quill pen with a finely cut nib and an extra long slit (about 5/8 inch) is used for laying the size. It is filled pretty full by means of a quill or a brush; if by the latter special care must be taken to avoid bubbles.

Experiments should be made in various methods.

I. Perhaps the best way of sizing small forms, so that the size may set properly and the burnish retain its brilliance, is to put on a thin coat with a pen—in the direct manner in which coloured Versals are made (q.v.)—and afterwards add two or three thin coats, allowing each coat to dry thoroughly. This requires considerable patience and skill, as it takes a long time, and there is a danger, in adding several coats, of spoiling the form by going over the edge. (For extra coats, or for large forms, a brush may be used.)

II. The simplest method for ordinary gold letter is to make them with one extra thick coat of size exactly like coloured Versals—first a natural pen outline, and then the filling in (see fig. 81). This requires some practice to do well, as the thicker size...

---

1 If this, as is not unlikely, will require twenty-four hours to dry, make sure, before laying the size, that you will be able to lay the gold-leaf on it at or near the same time on the next day (see p. 151).
more difficult to manage than the colour. Very narrow parts—such as the thin strokes—are apt to be deficient in size, and therefore, while they are still wet, the pen—held nearly vertical with the nib in contact with the surface of the size—is moved slowly along it until the stroke has received sufficient size and is properly filled out.

III. A method that may be found more convenient for heavy forms, is to hold the pen across the form to be gilded (which has previously been marked on the parchment) with its nib resting on the further outline (a, fig. 97). The nib being moved along that line, by contact with the parchment restrains the size from passing beyond it, while allowing it to flow out freely behind and below (a, 2). The opposite side is similarly treated, and, if the form be narrow, the size as it flows out blends with that already laid (b). The ends of the form are finished in like manner (c).

Should a drop fall on the page it can be removed quickly with the knife, but it is safer to allow it to dry and then to lick it off carefully. Size which has flowed beyond the bounds of the form may be trimmed away when it has set.

Fig. 97.
Laying & Burnishing
Gold

The angle of the pen with the parchment is less for a wider form (*b*, fig. 98).

![Angle of pen (a.) for narrow form](image1)

![Angle of pen (b.) for wide form](image2)

Fig. 98.

As a general rule the size should stand pretty high when wet; it shrinks in drying, and, if it forms too thin a coat, it will neither hold the gold-leaf fast nor burnish well. While the size is still wet it is easy to raise it to any height desired by running more size into the form in the manner described above. It is well, however, not to raise the size too high, as burnished gold too much raised looks out of place on a page and has a heavy and vulgar appearance (p. 184). Very high raising also does not dry so well, and when dry it is more liable to chip.

The work of laying the size should be carried out as quickly as possible. If one part of the form is left any appreciable time before the remaining parts are sized, the first part will begin to settle and dry, and the different layings will not blend or lie evenly. Though the size is thick and awkward to use at first, a little skill will coax it quickly and evenly out of the pen, and it will all blend and dry with an even surface.

When it is sized, put the work away to dry in a
drawer or safe place where it cannot be smudged or get dusty.

**Drying the Size.**—The time that the size is allowed to dry varies very much with the weather and the temperature; damp weather may make a longer time necessary, and dry weather or heat will shorten the time. The thickness of the raising affects the time very much; a very thin coat will dry in an hour or two, while an extra thick coat may take several days. Size not dry enough is too sticky to burnish; if too dry, it is so absorbent that it sucks up all the moisture which is breathed on it. To ensure the gold-leaf’s sticking thoroughly, it is safer on the whole to gild the size while it is still slightly damp, and delay the burnishing till it is drier.

The time to allow and the right condition of the size for gilding can only be accurately judged by experience.¹

**LAYING THE GOLD-LEAF**

**Note.**—In illuminated MSS., the simplest and best method to follow is to lay and finish the gold before applying the colours (the gold may be laid last of all if there should be a special risk of injury—pp. 170–1).

The process of gold-laying must be carried out steadily and quickly; all the necessary tools, &c., should be ready to hand (see p. 145).

**The Gold-Leaf.**—This is sold in books of twenty-five leaves. The ordinary leaf, about \( \frac{3}{4} \) inches square, consisting of gold and alloy, is said to be beaten out to less than \( \frac{1}{200,000} \) inch in thickness. As gold sticks readily to gold, especially when very thin and liable to wrinkle and fold over, or to paper, red

¹ The dryness of east wind or frost makes gold-laying and burnishing very difficult see p. 163).
bole or ochre is scattered between the leaves of the ordinary book. This powder will come off on the work and give it an ugly colour, when burnishing, unless it is dusted off very carefully.

It is better to get gold specially prepared for fine work such as illuminating quite pure, and put up in white books (without bole). "Double" gold-leaf may be used for a final coat.

Cutting the Leaf.—With the scissors, which must be quite clean and sharp—and not breathed upon—(or else the gold will stick to them and tear), cut a whole or half leaf of gold, together with the paper leaf on which it lies, out of the book.

The gold is cut on one paper (fig. 99) (not between papers, for then it would stick to both), and the cut edges of the paper and the gold stick together slightly. If the edge of the gold is anywhere loose and apt to flap about, it and the corresponding paper edge can be nicked together with the scissors (fig. 100). The gold-leaf being lightly held to the paper in this way is easily handled.

A piece of gold, about ⅛ inch larger all round than the form to be gilded, is cut from the leaf in the manner described above (a, b, fig. 100). Except in the case of a very large form, it is not worth trying
to save gold by cutting it out in the same shape. Square, oblong, and triangular shaped pieces are suitable for ordinary use; these are laid in a convenient place—the edge of a book cover will do very well (fig. 101) — ready to be picked up at the right moment.

The burnishing slab (a flat piece of vulcanite, celluloid, or metal) is placed under the page to give it a hard, firm back, which will make the pushing and rubbing of the burnisher effective.

Preparing the Size.—If the size has dried rough, it may be lightly scraped with the pen-knife—removing as little as possible of the surface in which the essential stickiness frequently seems to be concentrated.
Ordinarily a form should not require trimming, though if its edges have accidental roughnesses, these may be trimmed a little with the pen-knife.

_Damping the Size._—The breathing tube is about \(\frac{1}{2}\) inch (or less) in diameter, and 6 inches or more in length; it may be made of paper or cane. One end of the tube being lightly held between the lips, the other is moved about over the size, which is gently breathed upon (fig. 102). The breath condensining on the surface of the size, moistens it and renders it sticky. The amount of moistening required depends on the condition of the size.

Care has to be taken that the breath does not condense in the tube and drop on to the work.

_Laying the Gold-Leaf._—Immediately that the size has been sufficiently breathed upon, the piece of paper with gold-leaf adhering (held ready in the right
hand) is placed upon it, gold-leaf downwards, care being taken to place it steadily down, and not drag it across the size (fig. 103).

The Rubbing Paper—a convenient piece of thin but tough paper (held ready in the left hand)—is immediately laid above the gold-leaf paper, and is then rubbed over firmly with the finger-tip, in order at once to attach the leaf to the size (fig. 104). It is then quickly rubbed with the soft pencil or chalk

The burnisher is shown here—held in the right hand—ready for the next operation—See Figs. 106 & 107.

Fig. 104.
Laying & Burnishing Gold
till the raised form underneath is indicated on the surface of the paper (fig. 105).

These two operations may be combined by having a little blue chalk either on the finger-tip or on the upper surface of the rubbing paper.

Round the outline of this form the point of the burnisher\(^1\) is worked, pressing the gold-leaf firmly—through both the papers—against the size, in the angle formed by the size and the surface of the parchment (fig. 106).

The fore part of the burnisher is then passed rapidly all over the rubbing paper with a firm pressure (fig. 107).

The rubbing paper and the other paper are picked off, and an experienced eye can usually tell if the gold is sticking properly by a peculiar, smooth appearance which it then has.

Several Letters or Forms which are close together may be gilded simultaneously—with one piece of gold-leaf—as if they were one complex form. This saves time, but if too many forms are gilded together, some of them are liable to be less thoroughly and effectually treated.

Small Scattered Forms (dots, &c.).—For these the gold-leaf may be cut into a sufficient number of little pieces, which are allowed to fall \textit{(gold side downwards)} on a sheet placed to receive them. They

\(^1\) A finer metal or ivory point may also be used.
ure picked up separately by means of a needle stuck into their backing-paper.

Additional Coats of Gold-Leaf.—A second leaf of gold may be laid on immediately on the top of the first; this will ensure richness and facilitate burnishing. Additional leaves may be laid after burnishing, but, unless the first gilding is absolutely clean, there is a risk of the second leaf peeling off when re-burnished.

**Fig. 106.**

*Note.—Heavy pressure with a cotton wool pad on the back of the gold-leaf book paper (when that is sufficiently thin) may with advantage be used instead of the "rubbing-paper" and burnisher-point method here shown.*
The Burnisher.—A tooth-shaped agate burnisher (fig. 108) is commonly used.

The point is used for pushing the leaf into angles and for burnishing angles \((a)\).

The fore-part for general burnishing \((b)\).

The bend for cross-burnishing and for angles \((c)\).

The side for very gentle and light burnishing \((d)\).

The burnisher is kept scrupulously clean, and to ensure this it is frequently rubbed on a cloth.

Dusting off the Pounce.—The edge of the parchment may be tapped smartly on the desk to shake off the pounce, and a feather or a soft handkerchief may be used, care being taken not to brush the pounce over the gold.
Brushing off Waste Leaf.—The superfluous gold on the edge of the gilded form may be lightly brushed off with the brush, either after or before the burnishing—preferably after (see p. 170). Any gold which may have stuck to the surrounding parchment, in spite of the pouncing, may be removed with the knife or with the hard indiarubber point, being taken not to touch the gilded size.

For removing gold, ordinary baker’s bread is very useful, and safe.

Burnishing the Gold. —The gold-leaf may be burnished immediately after laying when the size is very dry, but it is safer to wait or a quarter of an hour—or longer, if the size is at all damp (see Drying, p. 151).

The slab is again put under the work, and the burnishing is begun very gently and cautiously: should the burnisher stick in the very last, it is instantly stopped (or else the gold will be scratched off), examined, and cleaned.

The first strokes of the burnisher are generally carried all over the work, very lightly and with a
Laying & Burnishing Gold

circular movement (fig. 109), till the gold begins to feel smooth, and the matt surface gives place to a dull polish.

As the gold gets smoother a little more pressure is used, and the burnisher is moved in straight lines in every direction across the gold (fig. 110). At this point the gold should have a peculiar and agreeable feeling of smoothness under the burnisher, an unmistakable sign that all is going well.

A rapid light polish with the bend of the burnisher across a gold stem will give a very good finish (fig. 108).

Properly burnished gold in a right light is at first as bright as a mirror, and in some lights may look
quite dark by reason of its smoothness. A piece of white paper may be held at such an angle that the white light from it is reflected by the gold; this will show the quality of the burnish, and also show up any brown spots which the leaf may have failed to cover. It is helpful, moreover, during the actual process of burnishing to have a reflecting paper folded and standing beside the work (fig. 111).

At first the size under the burnished gold is not thoroughly hardened, and great care should be taken of it (not to breathe on nor finger the gold in any way, nor allow it to lie about and get dusty). It is best to put it away safely in a drawer for a week or two.

After a week or fortnight, when the size has set a little more, it may be very gently re-burnished, and this may be done again at the end of another
Laying & Burnishing Gold

This final burnishing, when the size is nearly hard, will give it a very lasting polish. It is well, however, to take every care of burnished gold, and to secure it from risk of damage as soon as may be. Illuminated miniatures were often protected by a piece of silk between the leaves—and this should be done now, in the case of fine work. That a bound volume protects the burnished gold within it is proved by the large number of MSS. in which the gold, laid and burnished 500 years ago, is in perfect and brilliant preservation.

REMEDYING FAULTS IN GILDING

To lay and burnish gold satisfactorily requires considerable experience. Careful practice with a good “size” (a “home-made” size for preference—try recipes on pp. 166 and 147) will overcome the chief difficulties: these, and their probable causes are here summarised:

**To make the Size stick to the Surface.**

Clean and pounce thoroughly: roughen if necessary (pp. 146, 167).

Procure or make a proper composition, mix thoroughly always, and stir frequently when in use. If composition is at fault, add—

- Sticky matter.
- Toughening matter.

**Probable Causes of Size not sticking to Parchment or Paper**

Dirty, Greasy, Horny or Non-porous Surface.

Size not sticky enough.

Size not tough enough (and composition crumbling or mixing off)

162
To make the Gold-leaf stick to the Size.

Rebreath on thoroughly and avoid delay in laying the gold (p. 154).

Do not dry too long (p. 151). If fire with a steaming kettle having a long tube or spout will make gilding possible.

Use more careful pressure (p. 156): use thin gold leaf.

See above, p. 162.)

Size the size sufficiently (p. 150). If not enough when dry, roughen surface and add another coat.

Try re-gilding (p. 157), or, if spots persist, scrape them gently and try again: failing that, gently scrape off all the gold and try white of egg (dilute), or a slight re-sizing.

The spots are very small and there is not time to spare for re-gilding, they may be touched with powder gold and dilute white of egg, and burnished when dry (p. 183).

To make the Gold-leaf smooth and bright.

Allow longer time (p. 151).

Remove size and re-size with proper composition.

Sometimes this difficulty may be overcome by using several coats of gold-leaf (p. 157).

Scrape smooth with sharp knife. (Sometimes the size itself is burnished before the gold-leaf is laid.)

Lean burnisher frequently.

Probable Causes of Gold-leaf not sticking to Size.

Due to being insufficiently breathed on, or the too absorbent nature or condition of, size.

Dry, the dryness of frost or east wind makes the size dry, hard, and "difficult."

Not sufficient rubbing and pressing on of gold.

Size not sticky enough.

Not enough size, particularly in thin lines and edges.

The gold may refuse to stick in spots with no apparent reason, but probably from one or other of the above causes. Or the size may have been touched accidentally and have become greasy or dirty.

Probable Causes of Gold-leaf's not burnishing properly.

Due to—

a. Damp weather.

b. Insufficient time allowed for drying.

c. Too much sticky matter in size.

Size rough surfaced.

Burnisher becoming dirty.
Both paper and parchment when much wet with size are apt to cockle. Generally it is not possible or desirable (see p. 174), to guard against this by first stretching the material, but the size may be used with less water, so that it will dry sooner. In cases where there is a gold background it may often be divided into small parts (to be sized at different times) by the pattern (see p. 191). For large unbroken patches of gold several thin coats may be put on, one after the other, with a brush.

Some sizes have a tendency to crack: this is difficult to guard against. But, if the cracks are very minute—such as may be seen in many instances in the best early MSS.—they do not constitute a serious blemish.

Burnished gold is often damaged by careless handling or insufficient protection.

GOLD WRITING

The page (having been ruled as for ordinary writing) is thoroughly pounced all over.

The pen has an extra long slit, and the size made a little more fluid than usual to allow of it flowing freely and making true pen-strokes (p. 63).

The desk is lowered (fig. 46, b), or flat, so that the size may flow freely.

The nib sometimes makes only a wet down stroke on the parchment, but, by lightly pushing the pen up again, the stroke will be filled by the size which flows out from under the nib. Simple pen-strokes in small writing hold but little, and ought to be filled as full of size as possible (pp. 151, 184). They will be found to dry much more quickly than larger forms, and may be gilded within a few days.
burs of writing. Half-a-dozen or more letters are laid together (see p. 156).

OTHER METHODS & RECIPES FOR GILDING

Gold-leaf may be cut with a "gilder's knife" on "gilder's cushion," and picked up with a "gilder's p."

Water, white of egg, or alcohol may be used to make the gold-leaf adhere to the size.

"Transfer gold-leaf" is convenient, but the greasiness of the transfer paper is apt to dim the gilding.

Gold-leaf is made in many shades, from "red" (gold + copper) to "green" (gold + silver); though these may be used very effectively, they are liable to tarnish, and it is best to begin with pure gold (see pp. 152, 169).

Silver-leaf oxidises and turns black; platinum (a good substitute) costs about 5s., and aluminium (not good) about 6d. per book.

"Gold Ink" has been made with powdered gold: its effect is inferior to raised and burnished writing.

The following is from "The Book of the Art of Cennino Cennini" (written about the beginning of the fifteenth Century): Translated by Christiana Herringham, 1899:

"Chap. 157.—How you must do miniature-painting and put gold on parchment.

"First, if you would paint miniatures you must draw with a leaden style figures, foliage, letters, or whatever you please, on parchment, that is to say, in books: then with a pen you must make the delicate permanent outline of what you have designed. Then you must have a 165

Burnishing
Gold

paint that is a sort of gesso, called asiso, and it is made in this manner; namely, a little gesso sottile [see chap. 116, below], and a little biacca [whitelead], never more of this than equals a third part of the gesso; then take a little candy, less than the biacca; grind these ingredients very finely with clear water, collect them together, and let them dry without sun. When you wish to use some to put on gold, cut off a piece as large as you have need of, and temper it with the white of an egg, well beaten as I have taught you. [The froth is allowed to stand for one night to clear itself.] Temper this mixture with it; let it dry; then take your gold, and either breathing on it or not, as you please, you can put it on; and the gold being laid on, take the tooth or burnishing-stone and burnish it but hold under the parchment a firm tablet of good wood very smooth. And you must know that you may write letters with a pen and this asiso, or lay a ground of it, or whatever you please—it is most excellent. But before you lay the gold on it, see whether it is needful to scrape or level it with the point of a knife, or clean it in any way, for your brush sometimes puts more on in one place than in another. Always beware of this."

“Chap. 116.—How to prepare gesso sottile (slaked plaster of Paris) for grounding panels.

“You must now prepare a plaster for fine grounds called gesso sottile. This is made from the same plaster [plaster of Paris] as the last, but it must be well purified (purgata), and kept moist in a large tub for at least a month; renew the water every day until it almost rots and is completely slaked, and all fiery heat goes out of it and it becomes as soft as silk. Throw away the water, make it into cakes, and let it dry; and this gesso is sold by the druggists to our painters. It is used for grounding, for gilding, for working in relief, and other fine works.”
APPENDIX: ON GILDING

(By Graily Hewitt)

Success with raised gilding can only be expected when practice has rendered attention to the details of the process automatic and there is no need to pause and think. Even then the results must be somewhat uncertain and experimental. For our own preparations of size are usually unsatisfactory, and the ingredients of the best we can buy are unknown to us. And our vellum is certainly not of the quality we find in the old books. Some one is badly wanted to investigate the chemistry of the one and an appropriate preparation of the other. But we can take as much care as our time allows, passing nothing as "good enough" which we have not well examined, and bringing to the business all the patience and deftness available.

Vellum is too stiff, or too dry, or too greasy. When stiff, it is too thick for books; when dry, too apt to crack or cockle; when too greasy, exasperating. And yet the soft and rather greasy sort can be rendered more agreeable than the rest with labour. It should be rubbed by the flat of the hand with powdered pumice (or even fine sandpaper on the rough side) and French chalk, especially on its split (or rougher) side, until it is serviceable. A few trials will teach how long to give to this. Five minutes for one side of a lamb’s skin would not be too much. It can then be beaten with a silk handkerchief, but not rubbed with this until the size has been laid. It may be rubbed cleaner between the laying of the size and the gilding. Especially must those parts of pages be thoroughly rubbed clean which in the book, when made up, will lie upon, and be pressed against gold letters on the page opposite; or the pumice left behind will scratch them. On the other hand, if the vellum has not been thoroughly pumiced on both pages, the greasiness in
Laying & Burnishing Gold

it will dim the gold in time, both from above and below, or even make the size flake off altogether. The size is often blamed for faults of the vellum and its want of preparation.

Again size, or “raising preparation,” is too sticky or too dry. If the former, the gold will not burnish well; if the latter, it will burnish, but will not stick at the edges, and will crack sooner or later. And though the essential quality of gilding is brightness, one may be content to fail of this rather than have letters ragged in outline or broken on the surface.

The size in use should be just liquid enough to flow evenly from the pen. More water makes it dry too brittle, and tends to cockle the vellum also; less tends to blobbiness and unevenness. Even when it is put on fairly an uncomfortable groove is apt to form as it dries down the centre of letters; but this can be either filled up as soon as the first layer is dryish, or the sides of the groove can be scraped (when the letter is quite dry) down to the level of the groove itself with a sharp knife. The knife must be sharp. As this scraping does not affect the extreme edges the power of the size there to hold the leaf is not impaired by it; and certainly a well-scraped surface is extremely even and pleasant to gild. If the surface, however, be burnished and not scraped before laying the leaf, it will not hold the leaf well, and remains lumpy also where lumps were there originally; while scraping gets rid of these. During use the size should be kept thoroughly mixed; and a small sable brush serves well for this purpose, as soon as it can be used so carefully as not to cause bubbles.

To know the exact time to allow between laying and gilding one had need to be a meteorologist, so much “depends on the weather.” Very dry and very wet weather are equally unkind. Generally an interval of about twenty-four hours is right; but it is better to gild too soon than too late, provided one can be content, or testing the naked surface of the gilded letter with a
urnisher, and noting that the glitter is reluctant to come, leave the burnishing for a while, and only lay the leaf, pressing it well home to the outline of the letters. The burnishing can then be done in a few more hours. But if the size be too dry, the difficulty will be to make the leaf stick to it at all. In this case the leaf adhering can be scraped off, the size scraped down further, and another thin coat added and gilded after a shorter interval. If the letter be so fouled that such repairs are difficult, it would be entirely scraped away and the size relaid altogether. In doing this care is needed that the vellum be not injured round the letter.

The best gold-leaf for ordinary work costs about 1s. for twenty-five pages. More expensive leaf, being thicker, does not stick so well to the edges; cheaper is too thin to burnish well. Two kinds may be used together with good results, the finer leaf being put on next the size, and the thicker at once on to the top of that. The letter is then pressed and outlined as usual through paper, and the thin leaf will be found of considerable assistance towards the making of a clean cut edge. Generally, however, the piling on of several leaves is inadvisable, as bits are liable to flake away as the letter goes in drying, leaving dim specks where they have been. Yet if, after the outlining through the paper, the leaf is seen to be very dull or speckled with the colour of the size, this means that the size has been partly pressed through the leaf; and another laid immediately will have enough to stick to, and will burnish well. The best result comes of one moderately thick leaf laid and burnished at the right time as quickly as possible. Thicker leaves need only be used for large surfaces, where the edge can be scraped even and clean, or where a black outline is to be added.

As soon as the leaf is laid, and from that point onward, the breath must be kept from the letter with a shield (of cardboard or tin) held in the left hand or otherwise. Attention to this is responsible for many failures. Not
only should the actual letters under operation be so protected, but where a quantity are sized ready for gilding, on the page these should be protected also, as well as any parts already finished; for breath not only moistens but warms, and on warm size moisture condenses less easily. If the work to be done presently is so warmed, it will be found more difficult to deal with when its time comes. The first work done in the day is often the best, and for this reason, that the size for it is cool; but in gilding this portion one almost necessarily warms that to be done later. Two pages, where possible, should therefore be gilded alternately, one cooling while a portion of the other is gilded. Or thin plates of metal, or even cardboard, may be placed about as shields to protect all surfaces not under actual operation.

Superfluous gold is best removed by dusting lightly with an old and very clean and dry silk handkerchief. Indiarubber will certainly remove gold from the vellum, but it will as certainly dim any part of the gilding it touches. If the vellum was properly pounced to start with the silk will easily remove all the leaf unstuck, except little odds and ends, and these are safeliest taken away with the point of a knife.

As the pressure of burnishing helps the leaf to stick, it is best to wait till the letter has been burnished before this dusting. Such spots as are visible ungilded may be afterwards treated with a slight breath and transfer gold-leaf, or gold dust, may be painted on them. In the latter case the spots must be most carefully burnished, if burnished at all, or their surroundings will be scratched.

When a gold letter is to be set on a coloured background, or in the neighbourhood of colour, it is best put on after the colour; as may be observed was the method occasionally with the old books. If the gold is put on first it will certainly be dimmed by warmth and breath during the colouring. On the other hand, if it is put on last great care must be taken that the gold-leaf shall not stick to the coloured portions. Where possible, a stencil.
pattern of the parts to be gilded should be cut out of paper. This is easily made from a pencil rubbing taken after the size is laid, the raised pattern being of course cut out carefully a trifle larger than the outline so obtained. The paper is then laid over all the work, and the sized portions showing through the cuttings can be gilded without injury to the colour.

All gilded work should be retained, if possible, for a week or more, and then re-burnished. And in burnishing generally the burnisher should not be used, even when the size is hard, with any great force or pressure at first. For the size in drying sets as if moulded, and this mould cannot be squeezed about or actually crushed without being loosened or cracked. Throughout the whole process a gentle and vigilant alacrity is required. Success will come easily if it means to come. It cannot be forced to come.

The binder of a book with gilding in it should be warned to press the sheets as little as possible, and to use all his care in handling it, so as to keep moisture, warmth, and fingering from the gold. The folding of the sheets, when left to him, should also be done rather differently from usual, for all gilded pages need to be kept as flat as possible. None of the sizes in use seem capable of resisting bending of their surfaces without crimping or cracking. Where there is much gilding, the book will be the better for being sewn with a zigzag through the sections, as this helps to “guard” the gilded work.

CHAPTER X

THE USE OF GOLD & COLOURS IN INITIAL LETTERS & SIMPLE ILLUMINATION

TOOLS & MATERIALS FOR SIMPLE ILLUMINATION

The Use of Gold & Colours in Initial Letters & Simple Illumination

TOOLS, &c., FOR GILDING.—See Chapter IX. (pp. 145–6).

IVORY TRACING POINT.—This is useful for various purposes, and for indenting patterns in burnished gold (see p. 191).

BRUSHES.—Red Sables are very good. A separate brush should be kept for each colour—or at least one brush each for Reds, Blues, Greens, White, and gold “paint”—and it is convenient to have a medium and a fine brush for each.

PENS FOR COLOUR.—Quill pens are used: “Turkey” or “Goose.” The latter is softer, and is sometimes preferred for colour work. For very fine work (real) Crow Quills may be tried. A separate pen should be used for each colour.

COLOURED INKS.—Brown ink (tempered with black if desired) may be used for fine outlines; if the outlined forms are to be coloured afterwards it is convenient if the ink be waterproof. Coloured
The Use of Gold & Colours in Initial Letters & Simple Illumination

PAPER (see pp. 51, 98, 103)—PARCHMENT, VELLUM, & POUNCE (see below).

PARCHMENT, “VELLUM,” & POUNCE

See also Appendix on Gilding, p. 167 and pp. 98, 356)

The name “Vellum” (strictly applicable only to calf-skin) is generally given to any moderately good skin prepared for writing or printing on. All the modern skins are apt to be too stiff and horny: chemical action (substituted for patient handling), followed by liberal sizing and “dressing,” is perhaps responsible. The old skins have much more life and character, and are commonly much softer. Their surface is generally very smooth—not necessarily glazed—often with a delicate velvety nap, which forms a perfect writing surface.

Parchment (sheep-skin), as supplied by law-stationers, though rather hard, still retains the character of a skin, and is in every way preferable to the Vellum¹ which is specially prepared for illuminators. A piece of parchment about 26 inches by 22 inches costs about 2s. 6d. Lambskin is still better.

“Roman Vellum” is a fine quality of sheep or

¹ The very costly, specially prepared calf-skin is too highly “finished,” and has much the appearance of superior cardboard. It is stiff and shiny, and its surface is objectionable to work on.
The Use of Gold & Colours in Initial Letters & Simple Illumination

"lamb" skin, made in imitation of the Vellum used in the Vatican.

The surface of a modern skin may be greatly improved by "pouncing," but there seems to be a danger of its becoming rough or porous.

Pounce. — Fine powdered pumice (as supplied by drysalters) is very good. It is rubbed on with the hand (p. 167), or with a pad or a piece of rag. Law-stationers use a pounce in which the main constituents are chalk (or "whiting") and powdered resin. Chalk, Whiting, French Chalk, and Powdered Cuttlefish Bone might be used as substitutes for pumice, or as ingredients in preparing a pounce. Sandarach (a resin) rubbed on an erasure appears to prevent ink spreading when the surface is written over: it also makes an excellent pounce. I have not found any objection to its use before gilding, though resin is said to make the parchment sticky. (Before Writing, see Note 7, p. 359.)

A skin of parchment has a smooth (whiter) side—the original flesh side—and a rougher, yellowish side—the original hair side. The penman will find the smooth side preferable for writing on (though of course, both sides must be used in a book: see p. 110). This side is more easily damaged, and erasures have to be very carefully made with a sharp knife, or by gentle rubbing with indiarubber. On the rough side, erasures cause little or no damage to the surface. A piece of rubber—or a paper stump—dipped in pounce may be used. It is better—as it is more straightforward—to avoid erasures if possible, and to correct mistakes frankly, as in ordinary writing (see p. 344).

For ordinary purposes parchment should be cut to the size desired, and be held on the desk by th
pe, guard, &c. (see p. 50). It is generally a mistake to pin it down, or to damp and stretch it on the drawing-board (see p. 356).

Parchment is stained a fine purple with "Brazil-wood": this may be obtained from a "store chemist." Three teacups full of Brazil-wood are ewed in about two pints of water, with two teacoonsful of alum (which acts as a mordant). The colour of this liquid is brownish-red, and to make it purple, carbonate of potash is added (very carefully, it will become too blue). The liquid is poured to a tray, and the parchment skin is placed in it for half a day or a couple of days. The colour dries lighter, so it should be prepared rather dark, and diluted if necessary: strips of parchment should be used to test it; they are taken out and dried at the

The parchment skin is stretched on a frame, the edges being caught up over little buttons or pegs, and tied at these points with string. It is allowed to dry slowly.

COLOURS

POWDER COLOURS are the purest: they may be mixed with gum arabic and water. Yolk of egg and water is also used as a medium (or white egg) (pp. 179, 166). It is, however, more convenient for the beginner to use prepared colours.

CAKE COLOURS rank next to powder colours for purity: they seem to need tempering with a little gum or honey (or egg—see above) for use on ordinary parchment: used on it with water alone, they are apt to flake off when dry.

1 OXGALL may be used for a greasy surface; painted on it, mixed with the colour.
The Use of Gold & Colours in Initial Letters & Simple Illumination

*PAN COLOURS* are safe for ordinary use. *TUBE COLOURS* sometimes seem to have too much glycerine\(^1\); they are, however, very convenient for preparing mixed colours in any quantity because of their semi-fluid condition, and because the amount of each colour in the mixture may be judged with considerable accuracy by the length which is squeezed out of the tube (p. 178).

**COLOURS FOR PENWORK, &c.**—For simple letters or decoration it is well to use a pure

- RED—neither crimson nor orange tinged:
- BLUE—neither greenish nor purplish:
- GREEN—neither bluish nor “mossy.”

A little “body colour” is generally used with blues and greens to keep them “flat” (p. 118). These colours should be mixed as required, and be diluted to the right consistency with water (see p. 118). Colour which has been mixed and in use for some time—especially if it has been allowed to dry—is best thrown away (see *mixing size*, p. 148).

If there is much rubricating to be done, a quantity of each colour sufficient to last several days may be mixed, and kept in a *covered pot*. A little pomatum pot is convenient—the smaller the better, as it keeps the colour together, and does not allow it to dry so quickly.

The filling-brush (a rough brush kept for filling the pen) may rest in the pot (see fig. 112), being given a stir round every time it

---

\(^1\) Glycerine is a doubtful medium, and, in letters, &c., heavily loaded with colour, is apt to remain moist and sticky.
ed to prevent the settling of the heavy parts of the colour. A drop of water is added occasionally the liquid evaporates and becomes too thick.¹

**TINTS FEW AND CONSTANT.** — Red, Blue, and Green (and perhaps purple) with Gold, White, Black, are sufficient for everything but the most advanced type of Illumination. And it is in every way desirable that, until he has become a Master, the Writer and Illuminator should strictly limit the number of his colours (see p. 215).

It is one of the “secrets” of good “design” to confine a limited number of elements—forms or colours, materials—and to produce variety by skilful and charming manipulation of these. It is well to follow the early Illuminators in this: that these few colours be kept constant. When you have chosen a Red, a Blue, and a Green—as red and bright as you can make them—keep those particular tints as fixed colours to be used for ordinary purposes. For special purposes (pp. 182, 202) paler tints may be made by adding white, and varied tints may be mixed, but even when your work has advanced so that you require a more complex “palette,” you should stick to the principle of constant tints and types of treatment for regular occasions: this is the secret of method.

**RED.** — Vermilion is prepared in three forms: Vermillion, Scarlet Vermilion, and Orange Vermilion. For ordinary use “Scarlet Vermilion” is the best (it may be tempered with a minute quantity of white). “Vermilion” is not quite so bright, and tends more to crimson, but, mixed with...
The Use of Gold & Colours in Initial Letters & Simple Illumination

"Orange Vermilion," it gives the "scarlet" form. The pan colour is generally most convenient.

Where scarlet is in juxtaposition with gold, their effect may be harmonised by having a large proportion of blue in the neighbourhood: sometimes a more crimson colour than vermilion may be used.

*Chinese Vermilion* is a fine colour, but difficult to obtain; it is even said that the genuine pigment is reserved exclusively for the Chinese Emperor (whose edicts are written with "The Vermilion Pencil").

**GREEN.**—Verdigris is a very fine colour, closely resembling, and possibly the same pigment as, the green in early MSS., but I believe that it has not been rendered permanent in modern use.

*Green Oxide of Chromium* (transparent) (or "Veridian") is a very good permanent green. It is rather a thin colour, and requires body, which may be given by a little *Chinese White*; being a rather bluish green, it is the better for some yellow—*Aureolin*, the safest. This (mixed) green is most conveniently prepared from tube colours.

**BLUE.**—*Ultramarine Ash Blue* is a very beautiful colour. (Powder Ultramarine Ash—½ oz. about 4s.—with a little gum, is best. The preparations are made unpleasantly *slimy.*) It is rather pale when used alone. A mixture consisting of *Ultramarine Ash Blue* and *Chinese White* and (a very little) *Prussian Blue* makes an extremely fine, pure blue. A similar mixture with *cobalt* as a base makes a good blue.

*Ultramarine or Powdered Lapis Lazuli* (unfortunately known as "Genuine Ultramarine") is a fine colour; it may have a slightly purplish tint and need

---

1 "French Ultramarine" is an artificial compound, and a poor colour.

178
tempering with green to make a pure blue (whole cake about 18s.).

The Blue in common use in early MSS. (before Ultramarine came into use) has a fine, pure colour, and considerable body: it is more raised than any other colour; it is often seen to be full of little sparkles, as though there were powdered glass in it. It is supposed to have been prepared from a copper ore.

The following note on this blue has been given to me by Mr. C. M. Firth:—

"The blue is Native Carbonate of Copper finely powdered and tempered with white of egg (Vermilion is tempered with the Yolk)."

"The ore is of two kinds, a crystalline of a medium hardness found in France at Chessy, and hence called Chessylite, and a soft earthy kind which is obtained in Hungary, and largely now from Australia. The latter is from its ease of manipulation the best for paint making. It should be ground dry till it is no longer gritty and is of a sky blue (pale) colour."

"The Blue in MSS. was liable to wash off, but the oil in the Yolk prevented a similar result with the Vermilion. The Blue is identical with the Azzuro della magna (for d'allemaigne) of the Middle Ages. The frequently advanced hypothesis that the blue was due to a glass is based on the accounts of (I.) The Vestorian blue copper 'frit' for enamels probably; (II.) on the accounts in sixteenth century of the Manufacture of Smalt, which owes its colour to a glass tinted with Cobalt. This Azzuro is the oldest known Western blue, and was probably employed on Egyptian walls, where it has gone green, as also in Italian Frescoes."

"The Green tint of the chemical change in the Copper is seen in initials in books too much exposed to the damp. These exhibit a bright green tint in places where the colour was thinly applied."

179
The Use of Gold & Colours in Initial Letters & Simple Illumination

It appears that Yolk, besides being unsuited in colour for tempering this blue, changes it to a greenish colour (the effect of the oil, which forms about 22 per cent. of Yolk of Egg).

**WHITE.**—The tube *Chinese White*\(^1\) is the most convenient to use when tempering colours.

“*White Line or Hair Finishing*” (see p. 183). Various tools have been recommended for this. A sable pencil with the outer hairs cut away, “the smallest brush” made, and even a fine steel pen. I am inclined to believe that some of the early Illuminators used a fine quill—such as a crow quill, or a goose quill scraped thin and sharply pointed.

**PURPLE** is seldom used in simple pen-work lettering, &c., but largely and with very fine effect in complex illumination. A *reddish-purple* is to be preferred. A good colour can be made from the purple *stain* described on p. 175, or from Rubi madder and a little Rose madder, with a very little Ultramarine.

---

**SIMPLE COLOUR EFFECTS**

*Simple “Rubrication”* (see p. 127).—Red letters were most commonly contrasted with blue (the “warmest” and “coldest” colours),\(^2\) in some MSS with green alone, but more commonly the three

---

\(^{1}\) For white lining, &c.—if in constant use—the Chinese White in bottle is said to be the best; a little Spirits of Wine should be poured into it, to keep it moist and make it work better. It should be stirred well, and a sufficient quantity for immediate use is taken out and mixed in a small saucer. The bottle is kept tightly corked.

\(^{2}\) And single forms were often parti-coloured, as III., IV. *Blue*, with red serifs, or *vice versa* (see also pp. 208, 216).
Colours were used together, the alternations being generally—

**Repetition and Limitation of Simple Colours (and Forms).**—The uniform treatment of a MS. necessitates that no colour (or form) in it should be quite singular, or even isolated if it can possibly be repeated. If, for example, there be a Red capital on the "Verso" page, the "opening" is improved by some Red—a capital, a rubric, or even a line-finishing—on the "Recto" page. Very often the one piece of colour is very small, and, as it were, an echo of the other (compare Line-finishings and initials, pp. 205, 193). While it is not always possible or desirable so to treat both pages of an opening, yet, in the book taken as a whole, every colour used should be repeated as often as there is a reasonable opportunity. And, therefore, where the opportunities or colour in a book are few and far between, it is well to limit the "colours" used to two, or even one.

This necessity for repetition applies to simple rather than to complex "Illuminated" Forms—e.g. a book need not have more than one Illuminated Initial—but within such complex forms themselves
The Use of Gold & Colours in Initial Letters & Simple Illumination repetition is recognised as one of the first principles of "decorative design" (see p. 215).

Proportions of Colours.—In Harmonious Illumination, Blue very commonly is the predominating colour; but no exact proportions can be laid down, for the combined colour effect depends so much on the arrangement of the colours.

Effects of Neighbouring Colours.¹—When blue and red are in juxtaposition, the blue appears bluer and greener; the red appears brighter and more scarlet. With Red and Green, the Red appears more crimson, and the green, greener and bluer. A greenish blue will appear plain blue beside a pure green; a blue with a purplish tinge will appear more purple. Experiments might profitably be made with simple arrangements of Red, Blue, Green, Black, White and Gold in combinations of two or more.

Tempering Colours with White.—Forms such as flower petals, &c., may be painted in Blue or Red paled with White, and then be shaded with the pure colour; this gives considerable richness, and the effect may be heightened by very careful white line work (q.v.). Green leaves, &c., may be made very pale and then touched with Yellow—this gives a brilliant effect.

Black Outlines.—The effect of these is to make a bright colour appear brighter and richer, to define and, to a certain extent, harmonise, neighbouring colours and shapes, and to keep the design flat (see

¹ In "white light" three rays (known as the "Primary Colour-Sensations") have been distinguished—Red, Green, and Blue; any two of these are complementary to the remaining colour, and appear to be induced optically in its neighbourhood (Yellow light is combined of Red and Green rays, and this may partly explain the particular fitness of Blue and Gold Illumination.)
186). For one or more of these reasons, alloured forms—patterns, charges, &c.—in a com-
and colour scheme have an outline—strong or
dicate, according to the strength or delicacy of
work (see pp. 188, 187, 202, 221, 165).

White Lining.—A black outline is often separated
in the colour by a fine white line (see fig. 129).
hite lines also are used to harmonise colours, one
more commonly being painted (or “penned”) on
the colours. This tends to make the colours
bear paler and lighter—brightening them if they
are dark. Care must be taken not to overdo the
ite lining, or it will make the colours chalky and
d. White is also used in groups of dots, and in
the patterns on backgrounds (see pp. 213, 430).

Gold is even more effective than white or black
harmonising colours. It is commonly Burnished
bars or frames (p. 481), in spots (pp. 481, 187),
in large masses (p. 191). Matt Gold (see below).

Matt gold, or “shell gold”—the pure gold powder
supplied by a gold-beater) with a very little gum,
white of egg, is best—is generally painted upon
our. It was much used in old miniatures for
atching” and lighting landscapes, houses, cos-
mes, &c.; and stars, rays of light, and outlines of
buds were painted in delicate gold lines upon the
ue of the skies. Such gold lining has a very mellow-
g and pleasant effect upon colour, but it can easily
overdone. Matt gold may be used besides, for
 ters, ornament, and patterns painted upon colour.
uch forms have either no outline, or a very faint
le: their effect depends upon their lightness, and
ey are not made to appear solid.
A very pretty effect may be obtained in a small and not very formal manuscript by painting into the spaces left for the capitals little squares of red and blue, and painting upon these the letters and ornament—all in gold powder—very freely and quickly. The kind of treatment is rather crudely suggested by fig. 113. The pleasant appearance of the pages—as though they were scattered over with tiny squares of cloth of gold and red and blue—is produced with comparative ease, while the use of leaf gold might entail an expenditure of more time and pains than the book was worth. In the finest class of manuscripts, however, these matt gold letters would be somewhat informal and out of place.

**BURNISHED GOLD**

Gold is always raised, and burnished as bright as possible, unless there is a special reason for using matt gold.

The height to which it is raised varies, according to the effect desired, from a considerable thickness to the thinnest possible coat of “size.” Extremely thin and extremely thick raising are both objectionable (see p. 150): roughly speaking, a suitable height for any ordinary purpose is between $\frac{1}{16}$ and $\frac{1}{32}$ of an inch.

The surface, in the case of large forms, is generally made as smooth and perfect as possible, so that as Cennino Cennini says, the burnished gold “wit
appear almost dark from its own brightness”; and its brightness is only seen when the light falls on it at a particular angle. The gilding of a manuscript, however, is slightly flexible, and a large gilded surface is likely to be bent, so that some part of it is sure to catch the light.

Small surfaces highly burnished very often do not show the effect of, or “tell” as, gold, unless they catch the light by accident. It is well, therefore, where the forms are small to have several on the page, so that one or another will always shine out and explain the rest. And while the proper craftsman tries always to get the best finish which he reasonably can, the natural, slight unevennesses or varying planes of small gilded forms may be of advantage to the whole effect. The pleasant effect of such natural variations may be seen in thirteenth-century Initials, where numbers of little gold pieces are fitted into the backgrounds, and their changing surfaces cause the whole to be lit up with little sparkles of light. A parallel to this may be found in the hand-tooling of a book-cover, which sparkles with gold, because the binder could not press in each piece of gold-leaf absolutely level. On the other hand, the “deadness” of a machine-stamped cover is largely due to the dead level of its gilding.

Black and Gold.—One of the finest effects in calligraphy can be obtained by the simple contrast of gold capitals with black writing (see p. 299).

While, as in the case of black and red, the strongest effects are obtained by a marked contrast, gold may yet be very effectively used for small capitals throughout the black text. It does not lose or blend its brilliance with the black of the writing as colour is apt to do, but lights up and illuminates the page.

The Use of Gold & Colours in Initial Letters & Simple Illumination
For this reason gold will "help out" and make agreeable a black and colour effect which, by itself, would have been a failure (see p. 134).

**BURNISHED GOLD FORMS & OUTLINES**

*Plain gold letters, symbols, and other detached forms, not having backgrounds, are usually not outlined. An outline cheapens their effect, making them darker and heavier, and, if the line be at all thick, concealing the true form of the letter, and giving it a clumsy appearance.*

It is an instructive experiment to make a gold (or plain white) letter with a thick outline (*a*, fig. 114), and then paint a background round it. The effect is quite altered, and greatly improved (*b*, fig. 114).

The outline no longer tells as the outer line of the form, but partakes more of the nature of the background, in which it cuts out, as one might say, a little *niche* for the letter to rest in.

*Gold-leaf forms on coloured backgrounds are out-*
ied—generally in black—in order that letter and
background may together form a flat design, stable
and at rest in the page.

The distinction between the use of gold "paint"
and the treatment of a leaf gold form should be
carefully observed: the matt gold powder lies upon
flour, and may appear to blend with it (p. 183); the bright gold-leaf constitutes a distinct form, which
other lies upon the surface of a page, or is, as it were,
it in a background.

Gold (leaf) Floral Ornament, &c.—If the stalk
and leaves are both gold: they are commonly not
outlined, unless on a background.

If there be a thin stalk in black or colour with
old leaves: the leaves are outlined with the stalk-
blour (they were commonly furred: c, fig. 115).

If there be a thick coloured stalk with gold leaves:
both stalk and leaves commonly have a black outline,
the "leaves" often being treated as spots of gold
below).

Gold Spots or Dots are usually outlined and furred
with black (fig. 115). The effect produced is of a bright
old form on a grey back-

A simple "leaf" or de-
ached spot of gold has a
formless look, much as a
small blot of colour or ink
would have. The black out-
tine and the grey background-
effect seem in this case to give
form and interest to the spot;
at least they give it a place to rest in—a nest to hold
he small golden egg.

The Use of
Gold &
Colours in
Initial
Letters &
Simple
Illumination

187
The Use of Gold & Colours in Initial Letters & Simple Illumination

Even a stalk and tendril ($d$, fig. 115) has the same effect of giving intention and meaning to what might otherwise be a mere blot.

When several spots of gold (or colour) are arranged in a simple design, together they constitute a simple form which does not require a background. Thus the *line-finishing*: (a, fig. 126) has a formal and intentional arrangement in itself, and therefore need not be outlined.

**BACKGROUND CAPITALS**

*Background Capitals or Initials* frequently employ burnished gold, either for the letters or the ground. All the parts (including “solid” patterns) are generally outlined in black, or dark colour.

The commonest colours for grounds are Reds and Blues. The grounds are frequently countercharged, or made one colour inside and another outside the initial (p. 190). Sometimes little or no gold is used, and many fine white lines are employed to separate and harmonise the colours of the Initial and the ground. It is well, however, for the beginner to keep the letter and the ground distinct, by observing the Herald’s maxim, and using “Metal on colour, or colour on metal.”

*The forms of the letters* vary from those of ordinary capitals in being thicker in proportion to their height, and frequently in having no serifs. A very thin line or serif is apt to be lost in the background.

A very good form of background initial may be...
The Use of Gold & Colours in Initial Letters & Simple Illumination

Fig. 116.

thickening all its parts; in place of the serifs, cutting out and shaping the ends of the stems \((b, d)\) to a sort of "blunderbuss" pattern \((g)\).

**APPLYING THE BACKGROUND**

It is well first to make the letter,\(^1\) and then to **apply** the background to it (as though it were a sort of mosaic). The background is packed tightly round the letter, and the letter occupies the background,

---

\(^1\) In the case of a burnished gold background, the actual tinting of the letter may be deferred until the adjacent gilded arts are finished (see p. 151).
The Use of Gold & Colours in Initial Letters & Simple Illumination so that they appear to be in the same plane (fig. 117).

Such "flatness" is secured even more certain and effectively by using two colours (e.g. red and blue) in the background—one inside and one outside the letter (see Plate XII.).

The curves of the gold letter may with advantage slightly project, and so break the hard, square outline of the background.

The letter should not have the appearance of being "stuck on," as it is apt to if the background is large and empty, or if the ornament passes behind the letter (b, fig. 117).

In the case of letters with projecting stems or tails: the tail may be outside the background.
ne or both sides of the tail (b and c), or the whole field” may be enlarged to take in the complete letter (d).

There is no limit to the variety of shapes which backgrounds may take—symmetrical or asymmetrical, regular or irregular—provided they fit the initial or the ornament (which may itself partially, or entirely, bound them), are properly balanced (see Plate XII., and p. 419), and take their right place on the page.

ORNAMENT OF BACKGROUNDS

The ornament, as a rule, covers the background evenly, and is closely packed or fitted into its place. Gold grounds are generally thin, sometimes bearing patterns in dots. These are indented in the surface by means of a point (p. 172) which is not too sharp. It presses the gold-leaf into tiny pits, but does not pierce it. Gold grounds may be broken up into small parts by coloured chequers (p. 215) or floral patterns.
The Use of Gold & Colours in Initial Letters & Simple Illumination

Coloured grounds are, as a rule, more or less evenly covered with some form of decoration in thin white or matt gold lines, or in “solid” patterns in various colours (see pp. 202, 212). A simple and pretty diaper pattern may be made by diagonal lines of matt gold, cutting up the colour into small “lozenges,” each alternate lozenge having a fleur-de-lis or little cross, or other simple ornament (fig. 119).

A bolder design, in a broad white or coloured line, may be, as it were, woven through counterfeited slits in the letter (fig. 120). This helps to preserve th
The mimic slits are made by black lines drawn on the burnished gold of the letter. Where the stem of the ornament comes over the gold, the size is cut way with a pen-knife; the part hollowed out is painted with white to cover any blemishes, and then painted with the stem colour, and outlined.

A plain or pale stem may have a faint or brown outline, and be “shaded” at the sides (with reys, browns, or yellows) to give an effect of solidity; a stem that is painted in strong colour (e.g. red or blue) may have a central white line painted on it.

Note that where the initials have backgrounds, the line-finishings are commonly made with backgrounds to match, though their treatment is naturally much simpler (see Plates XV., XVII.).

CHAPTER XI

A THEORY OF ILLUMINATION

Illumination—“Barbaric, or Colour-Work, Illumination”—“Filigree, or Pen-Work, Illumination”—“Natural, or Limner’s, Illumination.”

ILLUMINATION

It is convenient to give a wide meaning to the word when we speak of an “illuminated manuscript,” for the scribe works with a very free hand, and when he wishes to decorate his pages he can write the
A Theory of words themselves in red, green, or blue, as easily as he could have written them in black. He can take a clean pen and a new colour and initial and "flourish" any part of the work to his heart's content. He may acquire the art of laying and burnishing gold, and no possible brilliance of effect is denied him—within the limits of his skill as an illuminator (see also pp. 298–299).

A limited number of specially prepared printed books can likewise be illuminated. But the greater the number of copies, the less labour may be spent on each one, and the more their illumination tends to be simple "rubrication"—adding coloured capitals, flourishes, and the like (see p. 127). And, if a large edition is to be decorated, the printer must be content to use black, or black and red, in woodcut or "process" work (see pp. 365, 372).

Illumination proper may be defined as the decoration by hand, in bright gold or colours, of writing or printing.

There are three broad types of illumination, which for want of better terms I distinguish as "Barbaric" (or colour-work), "Filigree" (or pen-work), and "Natural" (or limner's). These types run naturally one into another, and they may be blended or combined in every possible way, but it is convenient to consider them and the distinctive treatments which they involve separately.

"BARBARIC, OR COLOUR-WORK, ILLUMINATION"

(See also pp. 203, 208, 209, 215–18, 414, 421, 422)

This is mainly a colour treatment in which forms seem to be regarded chiefly as vehicles for colour.
effect appeals to the senses, rather than to the imagination; and such interest as the forms have lies entirely in their skilful disposal or intricate arrangement. Sometimes in their fantasy—where organic forms are introduced—as the “great fish” in the act of swallowing Jonah (in order to make the T of Γ), Plate XII. This type of illumination appears to have reached its climax of barbaric splendour in the twelfth and thirteenth centuries.

Though its revival nowadays might seem a little out of keeping with the more sedate and grown-up point of view of modern life, we cannot doubt that it is still lawful to decorate our work with the brilliance and splendour of gold and colours. Whether it expedient or not depends upon how it is done: to justify our work, it must succeed; it must be bright and splendid, and really gladden our eyes. And we must really take pleasure in the making of it, for we do not, we can hardly expect that it will give pleasure to others.

Simple and Complex Forms.—Between simple forms which are in a sense permanent—and complex forms—which are always changing—it is necessary to make a careful distinction.

An equilateral triangle drawn by “Euclid” and drawn by a modern Mathematician are, or ought to be, practically the same thing. If the painters made an ornamental band of geometrical forms, that is no bar to us; we also are at liberty to make decorative bands of circles, lozenges, or angles.

The ancient Romans made a capital A—its essential form (see fig. 142) two strokes sloped together and joined by a cross-bar (very like the “Pons inorum”), it could hardly be simpler—they used
A Theory of chisels and pens, which gave it its more characteristic
Illumination and finished form. If we use chisels and pens pro-
perly we shall get a similar result—not absolutely the same—for no two chisels or two hands can be quite the same—but closely resembling it and belonging to our own time as much as to another.

The essential form of the "Roman" A is a pure abstract form, the common property of every rational age and country,¹ and its characterisation is mainly the product of tools and materials not peculiar to the ancient Romans.

But when there is any real complexity of form and arrangement, or sentiment, we may reasonably suppose that it is peculiar to its time, and that the life and virtue of it cannot be restored.

It was common enough in the Middle Ages to make an initial A of two dragons firmly locked together by claws and teeth. Such forms fitted the humour of the time, and were part of the the natural "scheme of things." But we should beware of using such antique fantasies and "organisms" for medieval humour, together with its fauna and flora, belong to the past. And our own work is only honest when made in our own humour, time, and place.

There are, however, an infinite variety of simple abstract forms and symbols, such as circles, crosses, squares, lozenges, triangles, and a number of Alphabets, such as Square and Round Capitals, Small Letters—upright and sloping—which—weed...

¹ It has even been supposed that we might make the inhabitants of Mars aware of the existence of rational Terrestrials, exhibiting a vast illumination—in lamp-light—consisting of somewhat similar form—the first Proposition in Euclid.
Archaisms—we may use freely. And all these forms can be diversified by the tools with which they are made, and the manner in which the tools are used, and be glorified by the addition of bright colours and silver and gold. Very effective "designs" can be made with "chequers" and diaper patterns, and with the very letters themselves. And I have little doubt that an excellent modern style of illumination is quite feasible, in which the greatest possible richness of colour effect is achieved together with extreme simplicity of form.

"FILIGREE, OR PEN-WORK, ILLUMINATION"

See also pp. 205–208, 209, 218–20, 425, 428–29; figs. 79, 92, 125–26, 150, 188–89; Plates XI., XIII., XIV., XVII.)

This is a type of illumination which can safely be attempted by one who, having learnt to write, is desirous of illuminating his writing; for it is the direct outcome of penmanship (see p. 204), and consists mainly of pen flourishes, or semi-formal lines and shapes which can be made with a pen, suitably applied to the part to be decorated. Its effect may be very charming and restful: no colour standing out as in a positive colour scheme, no individual form catching the eye; but the whole having a richness of simple detail and smooth colouring more or less intricate and agreeably bewildering.

It may be compared to the tooling of a bookcover, both in the method of producing it, and in its effect. A book-binder has a number of stamps which bear the simplest forms and symbols, such as little circles and "leaves" and stars and curved lines,
A Theory of and with these simple elements he builds up a pleasant Illumination “design,” which he tools, usually in gold-leaf, upon the cover.

The scribe can vary the forms which his pen produces, and the colours which he gives them, with a freedom that the set form and the method of using the binder’s tools do not allow. But the skilled penman will find that his pen (or, at any rate, his penmanship) largely determines the forms of his freest flourishes and strokes, and that the semi-formal nature of such ornament demands a certain simplicity and repetition of form and colour, which do not unduly tax his skill as a craftsman.

Suppose, for example, that the scribe wishes to illuminate the border of a page of writing. He may choose a limited number of simple, pen-made forms for the elements of his design; say, a circle, a “leaf,” and a “tendril,” and a few curved flourishes and

![Fig. 121.

strokes (fig. 121), and with these cover the allotted space evenly and agreeably.
The ornament being treated as though it were a sort of floral growth, requires a starting point or "root." The initial letter is the natural origin of the border ornament, the stalk of which generally springs from the side or from one of the extremities of the letter. The main stem and branches are first made with a very free pen, forming a skeleton pattern (fig. 122).

Note.—The numbers in the diagram indicate the order in which the strokes were made. The main stem (111) sweeps over and occupies most of the ground; the secondary stem (222) occupies the remainder; the main branches (333, etc.) make the occupation secure.
Next the minor branches are added to cover the space evenly, and then the flowers, fruit, and bud—made up of combinations of the "leaves," circles, &c.—are more or less evenly disposed in the spaces formed by the large, round curve at the ends of the branches (fig. 123).
The "leaves" are laced all over, wherever there is convenient room for them just as the leaves of a real plant are). Then the stalks of the leaves are added, and, lastly, the interspaces are filled with "tendrils," which greatly contribute to the pleasant intricacy of the design (fig. 124).
A Theory of Illumination

Colour Schemes.—The safest treatment of such a "design" in black and gold (see p. 187). The leaves, which are rather flat, may be outlined after gilding. The flowers, &c may be made up in red and blue (tempered with white: see 182). This is the colour treatment of the example, Plate XVI.

If the leaves are green, the stem and outline may be more delicately drawn in pale or grey-brown ink, and the green may be a delicate pale olive or grey-green. (A strong, bluish stem with bright green leaves is apt to look crude and hard.) In such a delicate green plant border, delicate blue and red flowers, and one or two rather flat gold "berries" (single, or threes) may be placed.

A very effective colour decoration of a much simpler type may be made in red and green (or blue) pen-work—using the pen and the colours with which the Versal letters and line finishings are made. A red flourished stem with red leaves, tendrils, and green berries (or leaves) or a green stem with green leaves and red berries.

A floral pattern may also be made in plain burnished gold, both stem and leaves—not outlined (p. 187 & Plate XXII.).

A more complex decoration resembling the "flor filigree" has a "solid" stem in light or dark color on a dark or light ground (or on a gold ground as suggested in the rough diagram, fig. 120.

The examples of Italian fifteenth-century work in Plates XVIII. and XIX. show a related type of illumination, known as the "white vine pattern." Very carefully and beautifully drawn, it strongly suggests natural form.

"NATURAL, OR LIMNER'S,* ILLUMINATION"
(See also pp. 213, 219–21, 227, 423–24, 426–2486; figs. 131a–141; Plates XV., XVI., XXIII)

This, the finest type of illumination, has very great possibilities; and it is to be hoped that some craftsmen, who have the necessary skill, will find an opening for their work in this direction.

* Note.—Limning strictly means Illuminating, but has come to imply drawing and painting, especially of portraits and miniatures. Here, all its senses are intended.

202
Plate XV. is a thirteenth-century example of the transition from the “barbaric” to the “natural.” The dragon-tailed initial with its wonderful scroll-work and “ivy-leaf” being the perfection of barbaric form, carrying brilliant colour and serving to support and frame the delicate and beautiful drawing which it contains. But in the drawing itself the skill of a fine illuminator combines with the fancy of a cunning draughtsman to satisfy an aesthetic taste and appeal to the imagination.

Plate XVI. shows a rare, and singularly interesting, treatment of an Italian fourteenth-century MS. decorated with plant and insect forms (p. 427).

Plate XXIII. (modern) shows a border of wild roses and climbing plants: the colour treatment in the original is very brilliant (see p. 486).

The “natural” type depends very much on the beauty and interest of its form; and a draughtsman before he had become an illuminator, might be content to decorate MSS. and printed books with pen drawings only faintly coloured or tinted; but when he had mastered the limitations which the craft would impose on his drawing for pure and bright colour, there is no degree of brilliance, even unto barbaric splendour,” which he might not lay upon trained and delicate forms.

1 The modern illuminator, having no tradition for making such scroll-work, would find that natural or organic forms—as if trees or plants (see p. 221)—would serve the same end and have more “sweet reasonableness” in modern eyes. Excellent scroll-work, moreover, might be formed out of ornamental capitals—if sufficient excuse could be found for introducing them: a large flourished L, for example, could be made exactly in the same lines as the pendant and scroll in Plate XV. Narrow gold rods also may be used in a border to support floral growth, or as frames if necessary (compare rules, p. 364).
CHAPTER XII

THE DEVELOPMENT OF ILLUMINATION 1

THE DEVELOPMENT OF ILLUMINATION

An art or craft is so largely dependent on the tools and materials which are used by the craftsman, that we may reasonably say that it begins with the tools and materials, through which it has been produced. Now, "illumination" can be traced back step by step to simple penmanship. And its true development is most graphically sketched by Ruskin ("Lectures on Art," No. V.) when he says—

"The pen . . . is not only the great instrument for the finest sketching, but its right use is the foundation of the art of illumination. . . . Perfect illumination is only written made lovely; . . . But to make writing itself beautiful—make the sweep of the pen lovely—is the true art of illumination;" And also that those who have acquired "a habit of deliberate, legible and lovely penmanship in the use of the pen, . . . may next discipline their hands into control of lines of any length, and, finally, add the beauty of colour and form to the flowing of these perfect lines."

1 The steps in the development sketched very briefly in this chapter, refer both to the past history of the art of illumination and to its practical revival (see p. 16). Of something already done, of honour due, a friend reminds me: "William Morris was the first person in England to revive the art of writing and illumination, as he revived so many other arts, on the lines established by the ancient masters. Several books are in existence exquisitely written and decorated by him, notably Horace, a Vergil, and two differently treated copies of Omar Khayyám."
LINE-FINISHINGS

Line-finishings are used to preserve the evenness of the text when lines of writing fall short. When the space left is small, or occurs in the middle of a sentence, a quick stroke of the pen—often a continuation of the last letter, or springing from it—is insufficient (fig. 125); but where there are many and long gaps (as, for example, in a psalter at the ends of the verses), they may be filled in with dots (see late VIII.) or flourishes (a, b, c, fig. 126) either made in black with the script pen, or with another pen, in colour or gold.

Line-finishings commonly echo the treatment of the initials (see p. 181). In twelfth-century MSS. delicate flourishes are commonly found, in red, blue, or green—matching the colours of the Versals, and probably made with the same pen. The latter being rather finer than the text pen keeps these flourishes from appearing too prominent (see e, f, g. 126).

Such work should be simple and characteristic pen-work, showing the thickfs and thins and crisp curves, the result of the position of the pen, which usually "slanted" (see p. 43).

Bands of pen-made "geometrical" patterns—used with rather close writing—may be very simple and direct, though appearing pleasantly elaborate (see figs. 7 and (g) 126, Plate XIV., and pp. 215 & 25).

INITIAL LETTERS

The main development of Illumination was—and still is—bound up with the growth and decoration of the Initial Letter (but see footnote, p. 213).
The Development of Illumination

Fig. 125.

Line-finishing of Terminal strokes e / e f g e - e m y / s n - .

Some...out spread...H. in Lettering

ornamental
The Development of Illumination

Fig. 126.
The first step in this development is the master development of the pen-made Versal letter, and the right treatment of simple coloured capitals (see chapters VII, VIII., and X.). The next step is their elaboration. The simplest ornamental treatment is found in the flourishing of a terminal of the initial letter (fig. 150) or the arrangement of the remaining letters of the word inside or beside it. Pen flourishes may consist of the simplest curved and zigzag strokes (sometimes springing from the actual letter: see p. 251), ending with a "twirl" of the pen in a loop or a "bud" (figs. 150, 79); or they may strike out a sort of formal floral pattern, filling or surrounding the initial (fig. 92), and such a pattern in its turn may spring from the letter into the margin, and grow into a complete "illuminated border" (see p. 199).

**Hollow Letters.**—A large capital is often made hollow, primarily with a view to lightening its appearance, which might be rather heavy if the letter were made solid (p. 119). The hollow—which commonly left plain (i.e. the colour of the paper or parchment)—may be a mere line, straight or curved or zigzag (fig. 189), or a pattern, or lettering (fig. 89). Sometimes it is made large and filled in with contrasting colour, leaving a white line, however between the two colours. And sometimes half a letter is made in one colour, and the other half (on the opposite side of the hollow centre) is made in contrasting colour. A "hollow" letter (especially if very large) may be strengthened and improved by a filling of colour or ornament. (*Addenda*, p. 25.)

**"Woven" Forms.**—A simple form of ornament (related to "Basket work") which effectively strengthens the construction of a hollow letter—without impairing its lightness—consists in a crossing...
The elaborated $\mathbb{E}$ (in fig. 127) is from a 10th 11th century MS. (Brit. Museum, Egerton, 8). The Initial and its inwoven ornament cut the background into a number of distinct parts distinctly coloured). Note also that the entire background is contained by the Initial.

The "knot" (fig. 127), or a basket-work ornament, is sometimes used as an arbitrary starting-point for a filigree border (see p. 428) where an initial is lacking.

*Variety in Initials.*—The sizes and styles of the initials which are used for the same purpose throughout the book vary very slightly or not at all. Generally, the more important the division which the
initial marks, the larger the initial and the more ornate (p. 298). A slight complexity in the opening letter or word of a book does not seriously interfere with the readableness of the book as a whole. The general rule is followed that the greater the number of (decorative) forms the plainer they are kept (see p. 126), and if a book contained an "initial" on every page, it would be both an artistic and a working economy (if there were many pages) to make the majority of them rather plain.

But however simple the treatment of the initial may be, there is still room for considerable variety in form or ornament or type—as "round" or "square" letters (see fig. 80, and especially Plate XI.). Such variety is found in the best work; it adds a liveliness and charm which are quite lacking where there is unnecessary or mechanical repetition.

"Lombardic" versus Roman Capitals.—The round fat letters which are known as "Lombardic" (see fig. 1, and Plates XV., XVII.) have been generally used for "illuminated initials" in Northern Europe since the thirteenth century. But—though they are capable of very beautiful treatment—they are rather doubtful models for us to follow. The fact that such letters will always pack neatly into a square niche or background—though an obvious convenience—is not an unmixed advantage. And the majority of examples show a debased type of Letters—often so unlike their originals, and so like one another as to be scarcely readable. For the sake of readableness the stems should be made longer (fig. 12). The more slender "Roman" type of initial, commonly used in Italy (Plate XVIII.), is in every way a more legible letter. The Roman Alpha still remains the finest model, and it is better th
The lettering should be almost too slender and delicate, than that it should be at all heavy or clumsy.

**BORDERS & BACKGROUNDS**

The illuminated border was originally an extension or branching out of the initial decoration. It commonly occupied the greater part of the left-hand margin, and from thence it extended into the head\(^1\) or foot margin (or into both), or completely surrounded the text, and even the eight margins of a

---

\(^1\) Where it is possible it is desirable to mark the top left-hand corner of the "page" (and also the lower corner) by a branch, flourish, bud, or flower (see Plates XIX., XXII.). A top left-hand corner appearing vacant or rounded off is apt to weaken the whole effect (see p. 134).
Note.—This diagram suggests a simple treatment of an initial word in colours—gold. The graphic method employed heretofore for indicating these—by lines & dots—is here discarded for the stronger contrasts of black, white, and "grey."

The letters contained inside the initial are kept distinct—(1) crimson ("grey" diagram) being used solely for the patches ground adjoining the (gold) letters, and filling the hollow part of the (gold) P, the whole word stands out in crimson and gold (2) the floral pattern is also in gold, but does not cover or hide any part of the word.

The remaining ground is green inside a blue outside the P. The doors are red on the green ground, in cream with red centre dot on the blue.

The gold throughout is outlined black, and the blue ground has a black outline, separated from it by a white line.

212
complete opening are sometimes covered with illumination. In late and modern usage the border is frequently separated from the initial, constituting a "framing border." 1

In some MSS. there are two side-borders on a page, one springing from the Initials on the left, the other sending branches into the gaps on the right (see Plates XVII., XVI.). In some cases the two pages of an opening are balanced by a side-border in each of the wide side margins (p. 428).

Backgrounds of Initials (see pp. 188-193, 421-23) and borders are treated very similarly. It may be noted that, where a solid-stem pattern cuts up the round into small pieces, these are often painted in different colours—commonly red, and green, and blue (see pp. 209, 430). And the groups of dots (fig. 29)—in white or other colours—may fill the interstices of a background, putting the finishing touch to the even covering and pleasant intricacy of the decoration (comp. p. 201). Or little flowers and leaves may be used instead—growing from a thin white) stem which appears to twine throughout the main pattern—just as the smaller plants in a hedge creep among the larger stems. There is no better model in nature for the illuminator than a country hedgerow.

1 Narrow ornamental frames are to be found in early MSS. before the full development of the Initial Letter. These, like various other primitive ornaments, such as are suggested at p. 195, 196 & 215-216, are not an outgrowth of the Initial. Whether narrow or broad, framing borders, or borders which surround the text, should generally not encroach on the writing-space (which is kept uniform throughout the pages of the book), though broad framing borders may be allowed nearly to fill the entire marginal space.
CHAPTER XIII

"DESIGN" IN ILLUMINATION

"Design"—Elementary Patterns in Decoration—Scale & Scope of Decoration—Of "Designing" Manuscripts, Generally.

Perhaps the nearest right definition of "design" is "contrivance"—applied to the actual doing of the work, rather than to the work when done: "decoration" (when that is the sense intended) is a safe word,¹ because it implies "of something." And generally that "something" lies at the root of the matter. For example: "illuminated initials" and "illuminated borders," so called, are really illuminating: they are properly a decoration of manuscript or print.

To consider a "piece-of-decoration" as a thing existing apart from that which it decorates, as something drawn or copied, and, so to speak, stuck on to the finished work, is as unnatural as it would be to contemplate the flame-of-a-candle as a thin apart from the candle.

¹ "Design" has been associated so much with bad cleverness in the artist, or clever badness in the natural man, that if we use the word in a good sense it is apt to be misunderstood.

Decoration is derived from decus, decor = comeliness or grace.
The finest decoration is really part of the work itself, and may be described as the finishing touches even directly to the work by the tools which are properly employed on it.

The illuminator has, as a rule, to decorate a given manuscript with pen or brush work—it may be with the simplest pen flourishes, or with the most laborate figure “design.” How to make that illumination part of the work, he can learn only by patient practice and by careful handling of his tools.

ELEMENTARY PATTERNS IN DECORATION

Nearly all simple Decoration consists of a comparatively limited number of elements—simple forms and pure colours—which are built up into more complex forms to occupy an allotted space. A primitive type of such built-up decoration is seen in the dotted patterns, which are found in every age—in the remains of the most ancient art, and in the shell ornaments which children make on the sands at the present day. Examples of dotted “backgrounds” in the “Durham Book” are shown in fig. 130 (a and ). Chequers and Diapers—in which two or more elements are employed—are related patterns.¹ (See also Addenda, p. 25 & fig. 191a.)

A simple way of filling a band (or long narrow

¹ Chequers in colours and gold were largely used in the fourteenth-century MSS. for backgrounds in miniatures. There is an example of very beautiful heraldic diapering (in enamel) on the shield of William de Valence, Earl of Pembroke, in Westminster Abbey (a.d. 1296). On p. 336 of this book there is diagram of a very fine shield bearing a diapered chequer.
“Design” in space) is to run a zigzag line along it (c). This may be treated either as a line or wavy stem, which may send out buds, leaves, or flowers into the space (g), or as two series of triangles which may be “countercharged” (f).¹ A second zigzag, cutting the first, would produce two series of triangles and a central row of lozenges (d). And it is not a very great step from this to the “twist” where the two lines pass over and under, the line being made “solid” in white or gold on a colour background (e, fig. 130). The main difference appears to be that while the one is of the nature of an abstract form, the other suggests a concrete form, such as might be made with twisted cords or rods.

These primitive patterns never become antiquated; they are still the root forms of “design, and the pleasant even covering of a given space by simple elements—which is their métier—account for much of the unconscious pleasure which we take in good bricklaying or sewing or writing, and in a thousand things, where “many littles make mickle.”

For their decorative possibilities in Illumination we can experiment in the most delightful way—framing our writing with bands of countercharged triangles in burnished gold, and blue and white, with golden zigzags on a blue ground, or chequerings backgrounds with scarlet and blue, and trying hundred and one other ways (p. 197). Such patterns have been made the most of in Heraldry, an a

¹ If the triangles were countercharged in colour and color —e.g. red and blue—the zigzag would be made white, black, gold, to separate and harmonise the colours (see pp. 182–83).

“Design” in which in itself would form a foundation for a splendid and complete scheme of Illumination.

SCALE & SCOPE OF DECORATION

Penmanship.—Many of the most beautiful MSS were made in pen-work throughout. And it is well that the penman should stick to his pen as much as possible. Not only does it train his hand to make pen ornaments, the forms of which are in keeping with the writing, but it helps to keep the decoration proportionate in every way. It is an excellent plan for the beginner to use the writing-pen for plain black capitals or flourishes, and to make all other decoration with similar or slightly finer pens than the one used for the writing.

Again, the direct use of the pen will prevent much mischievous “sketching.” Sketching is right in its proper place, and, where you know exactly what you wish to do, it is useful to sketch in lightly the main parts of a complex “design” so that each part may receive a fair portion of the available space. But do not spoil your MS. by experimental pencilling in trying to find out what you want to do. Experiments are best made roughly with a pen or brush on a piece of paper laid on the available space in the MS., by colouring a piece of paper and cutting it out to the pattern desired and laying it on. Such means are also used to settle small doubts which may arise in the actual illuminating—as to whether—and when

1 A most beautiful twelfth-century MS., known as the “Golden Psalter,” has many gold (decorated) Initials, Red, Blue, and Green (plain) Versals and Line-Finishings, every part being pen-made throughout the book.
some form or some colour should be placed on the page.

Filigree, Floral, & other Decoration.—The acquired skill of the penman leads very naturally to pen flourishing and decoration of his work, and is again to many different types of filigree decoration more or less resembling floral growths (see figs. 85, 126; pp. 197–202; Plates XI., XVII.).

Now all right decoration in a sense arranges itself, and we may compare the right action of the designer's mind to that necessary vibration or directive motion which permeates the universe, being communicated to the elements, enables the various particles to fall into their right places: when iron filings are shaken near a magnet they range themselves in the natural curves of the magnetic field, or as a cello bow, drawn over the edge of a sand-sprinkled plate, gathers the sand into beautiful "musical patterns."

And to most natural growths, whether of plants or ornament, this principle of self-arrangement seems common, that they spread out evenly and occupy to the greatest extent possible their allotted space. Branches and leaves most naturally grow away from the stem and from each other, and oppose elbows and points in every direction. In this way the growth fits its place, looking secure and at rest—while in disconnected parallels, or branches following their stem, there is often insecurity and unrest.¹ (See also Addenda, p. 25.)

For example: a circular space is filled more

¹ In a spiral the stem, following itself, may be tied by an interlocking spiral, or the turns of the spiral may be held at rest by the interlocking of the leaves (see G, Plate XXII.).
"Design" in decoratively by a cross \((a\), fig. 131\) than by a contained circle; a square is better filled by a "lozenge" or circle \((b\ and \ c)\) than by a smaller square set square and parallel (compare the diapering of the check in fig. 191 \(a\)). A circular or square space might be filled on this principle with a filigree arrangement such as is suggested by \((d\), fig. 131\). \textit{Note.}—In the case of two curves in the ornament touching (either internally or externally) they may be linked at the point by a (gold) band or circle or lozenge \((e\), fig. 131; see also Plate XVII.).

\textit{Miniatures and Drawing.}—In drawing and painting, the difficulty which is apt to beset the illuminator is how to strike a balance between "Naturalism" and "Conventionalism," so called. While the only criterion is good taste, we may be guided by certain general principles.

To limit the number of elements in a "design"—whether of form or colour—is nearly always
vantage (pp. 177, 181, 198). And the miniaturist, while depicting the nature of a plant, usually limits the number of its branches and leaves and shades of color. Every part of a "design" should be drawn clearly and distinctly, and in proportion to the whole. The miniaturist, therefore, usually draws in careful line every branch and leaf, making the whole proportional with the MS. which it decorates.

In fact, the qualities of good illumination are the same as the qualities of good writing—Simplicity, distinctiveness, Proportion, &c. (see p. 239). And "convention" (here literally a coming together) required is only such as will make the drawing and wording of the illumination and the form and wording of the writing go well together.

Note.—Figs. 135 to 141 (woodcuts—with part of the text—a Herbal printed at Venice in 1571 [p. 369]) and figs. 132, 133, and 134a (wood engravings by T. Bewick, printed 1791) suggested as examples of drawing—of plants and animals—able for book-decoration (see also figs. 134b, c, d; Plates XV., I., XXIII., and notes on "limner's illumination," p. 203).

OF "DESIGNING" MANUSCRIPTS GENERALLY

Cultivate the simplest and most direct methods, make "rules of thumb" for work-a-day use, to try successfully through all routine or ordinary acuities, so that your hand will be trained and your mind free and ready to deal with the harder blèmes when they arise.

As an example of a good "rule of thumb," use the ruled lines manuscript as a scale for other measurements and proportions, ing one, two, three, or more of the line-spaces for capitals, elements, &c.: you have this scale—as it were, a "ready oner"—present on every page, and following it enables you easily to make the decoration agree and harmonise with written text and with the book as a whole (see p. 128 & 89, 91, 71).
"Design" in Use a limited number of pure, bright colour Illumination and keep your work clean, neat, and definite.

Go straight ahead, trusting to workman-like methods, and not calculating overmuch. Do the work in a regular order, settling, first, the general scheme, the size of the book, the writing, and the margins; then when you are ready—

1. Prepare the sheets (see pp. 99, 110, 167).
2. Write the text—leaving spaces for decoration.
3. Write (a) The coloured writing.
   (b) The coloured capitals.
   (c) The line-finishing.
4. Illuminate—(a) The Initials. Following a regular order in the various processes involved
   (b) Line-finishing.
   (c) The Borders.
5. Bind the book (p. 346), or have it bound, order to make a real and finished piece of work.

Practise an artistic economy of time and space; usually the quicker you write the MS. the better it is. Allow sufficient margins to make the book readable and handsome, but not so wide as to make it appear fanciful. Allow sufficient ornament, not overloading the book with it. Let the ornament be of a type suited to the book and to the subject-
not too painstaking or elaborate in an ordinary MS: not too hasty and slight in an important work.

Endeavour to strike a balance between what may be called "practical" and "ornamental" considerations: an illuminated MS. is not meant to be entirely "practical," but it is a greater failure if made entirely "ornamental." Let the text be readable in every sense, and let the ornament beautify it: there should be give and take, as it were, and that most desirable quality—"sweet reasonableness."
The White-Antelope, which is supposed to be the same with the Pygarg, mentioned in the book of Numbers, is an inhabitant of the Cape of Good Hope, where it is called the Spring-bok; and is to be seen in herds of several thousands, covering the plains as far as the eye can reach. Sparrman says, that, having shot at a large herd of them, they formed a line, and immediately made a circular movement, as if to surround him; but afterwards flew off in different directions.

The height of this beautiful creature is two feet and a
THE CHEVROTAIN AND MEMINNA.

The Chevrotain, or little Guinea Deer, is the smallest of all the Antelope kind, the least of all cloven-footed quadrupeds, and, we may add, the most beautiful. Its fore legs, at the smallest part, are not much thicker than a tobacco-pipe; it is not more than seven inches in height, and about twelve from the point of the nose to the insertion of the tail; its ears are broad; and its horns, which are straight, and scarcely two inches long, are black and shining as jet; the colour of the hair is reddish-brown; in some a beautiful yellow, very fine and glossy.

These elegant little creatures are natives of Senegal and the hottest parts of Africa; they are likewise found in India, and in many of the islands adjoining to the vast continent.

PART II
LETTERING
GOOD MODELS

lettering is to be rightly constructed and arranged, the study of good models is essential. Some of the writing and lettering in the old MSS., and the letters ed on various old tombstones and brasses, weeded archaisms, will be found almost perfect models. et to select one of these from the many which are more or less” good, requires much discrimination. It is suggested below that the essential virtues of good lettering are *readability*, *beauty*, and *character*. Then, we can discover some of the underlying qualities which make for these, our choice will at last be better considered, and instead of forming our
Some Methods of Construction & Arrangement

"style" on the first type of letter that pleases, we shall found our work on a good model, full of possibilities of development.

The Roman Capital (Chap. XV.).—The ancestor of all our letters is in undisputed possession of the first place: but it is open to comparatively few to make a practical study of its monumental forms by means of cutting inscriptions in stone with a chisel.

The Pen-formed letters are more easily practised and the mastery of the pen acquired in the practice of a root form—such as the half-uncial—is the key to the majority of alphabets (which are pen developed) and to those principles underlying the right construction and arrangement of lettering, which is our business to discover.

Doubtless a "school" of lettering might be founded on any fine type, and a beautiful alphabet or fine hand might be founded on any fine inscription: but the practical student of penmanship may be sure of acquiring a knowledge of lettering which would be useful to any craftsman concerned with letters, be he printer, book-illustrator, engraver, or even inscription carver.

THE QUALITIES OF GOOD LETTERING

The first general virtue of lettering is *readability*, the second, *fitness* for a given Use. And the rational basis of the following summary is the assumption that such *fitness* is comprised in *beauty* and *character* and that a given piece of lettering having *readability, beauty, and character* has the essential virtue of good lettering.

The qualities on which these virtues seem chiefly to depend, and their special significations in the case of plain writing, may be set forth as follows:—
THE QUALITIES OF GOOD WRITING

READABILITY

1. Simplicity: As having no unnecessary parts (and as being simply arranged: see 6).
2. Distinctiveness: As having the distinguishing characteristics of each letter strongly marked (and the words distinctly arranged: see 6).
3. Proportion: As having no part of a letter wrongly exaggerated or dwarfed (and as the lettering being proportionally arranged: see 6).

BEAUTY

4. Beauty of Form: As having beautiful shapes and constructions, so that each letter is an individual and living whole (not a mere collection of parts) fitted for the position, office, and material of the object bearing the inscription.
5. Beauty of Uniformity: As the assimilation of the corresponding parts — "bodies," "limbs," "heads" — and as the "family likeness" of the different letters, so that they go well together.
6. Beauty of Arrangement: As having a general fitness in the placing, connecting, and spacing of letters, words, and lines, in the disposal of the lettering in the given space, and in the proportioning of every part of the lettering and its margins.

CHARACTER

7. Essential qualities of (Hand and Pen) work: As being genuine calligraphy, the direct outcome of a rightly made and rightly handled pen. (See p. 278.)
8. Freedom: As having skilled and unaffected boldness. (See pp. 122, 327, 323, 369.)
9. Personality: As having the characteristics which distinguish one person's hand from another's. (See also pp. 278, 323.)
This summary, while not presuming to define the *Virtues*, or achieve *Beauty* by a formula, does indicate some guiding principles for the letter-maker, and does suggest a definite meaning which may be given to the terms “Right Form,” “Right Arrangement,” and “Right Expression” in a particular craft.

It is true that “Readableness” and “Character” are comprised in *Beauty*, in the widest sense; but it is useful here to distinguish them: *Readableness* as the only sound basis for a practical theory of lettering, and *Character* as the product of a particular hand & tool at work in a particular craft.

The above table, therefore, may be used as a test of the qualities of any piece of lettering—whether Manuscript, Printing, or Engraving—provided that the significations of those qualities on which “Character” depends be modified and adapted to each particular instance. It is however a test for general qualities only—such as may help us in choosing a model: for as to its particular virtue each work stands alone—judged by its merits—in spite of artificial rules.

**Simplicity**

*(As having no unnecessary parts)*

*Essential Forms and their Characterisation.*—The “Essential Forms” may be defined briefly as *the necessary parts* (see p. 275). They constitute the skeleton or structural plan of an alphabet; and One of the finest things the letter-craftsman can do, is to make the Essential Forms of letters beautiful in themselves, giving them the character and finish which come naturally from a rightly handled tool.
If we take the "Roman" types—the letters with which we are most familiar—and draw them in single pencil strokes (as a child does when it learns its letters"), we get a rough representation of their Essential Forms (see diagram, fig. 42).

Such letters might be scratched with a point in wax or clay, and if so used in practice would give rise to fresh and characteristic developments, but if we take a "square cut" pen which will give a thin horizontal stroke and a thick vertical stroke (figs. 10 and 40), it will give us the "straight-pen," or simple written, essential forms of these letters (fig. 143).

These essential forms of straight-pen letters when compared with the plain line forms show a remarkable degree of interest, brought about by the introduction of the thin and thick strokes and gradated curves, characteristic of pen work.

Certain letters (A, K, M, N, V, W, X, Y, and \(v, w, x, y\)) in fig 143 being composed chiefly of oblique strokes, appear rather heavy. They are lightened by using a naturally "slanted" pen which produces thin as well as thick oblique strokes. And the verticals in M and N are made thin by further slanting the pen (fig. 144).

To our eyes, accustomed to a traditional finish, all these forms—in figs. 143 and 144, but particularly the slanted pen forms—look incomplete and unfinished; and it is obvious that the thin strokes, at least, require marked terminals or serifs.

---

1 In fact, our "small-letters" are the formalised result of the rapidly scratched Square Capitals of the Roman era (p. 37 & f. 3).

Fig. 143.
Good Lettering—Some Methods of Construction & Arrangement

**Finishing-Strokes.**—The pen naturally produces variety of finishing-strokes—"heads," "feet," serif &c.—each type of which strongly characterises the alphabet in which it is employed.

The main types (fig. 145) are—

(a) Hooks or beaks.
(b) Straight (or curved) strokes, thick or thin according to the direction of the pen.
(c) Triangular "heads" (and "feet"), straight slanted, and more or less curved and sharpened.
(d) Thin finishing-curves, horizontal or oblique.

To give uniformity to the various letters of alphabet it is necessary to treat similar parts consistently as possible throughout (see No. 5, 239). And the remarkable way in which "head" impart a "family likeness" to letters closely resemble the same phenomenon among human beings (s pp. 324, 254).

If we consider the four types of serif, as applicable to straight-pen writing, we find—

244
Hooks or Beaks
Thin Finishing-Curves
Straight (or Curved) THIN Strokes
Triangular “Heads”

Suitable only for certain parts of certain letters (and for informal writing).
Informal (or Ornamental).
Formal and capable of imparting great elegance and finish.

For a formal, straight-pen writing, therefore, we may assume that a form of triangular head is, on the whole, the most suitable, while some of the letters may be allowed to end naturally in finishing hooks and curves.
Good Lettering—

Some Methods of Construction & Arrangement

Heads are easily built up at the ends of thick strokes, but some practice is required to enable a penman to make them on the thin strokes properly and skilfully. On the thin horizontals they are made with an almost continuous movement of the point of the nib from the thin stroke itself (see (a) to (h) fig. 146) closely resembling the termination of some of the thin strokes in the Irish half-unc (Plate VI.). On the thin oblique or vertical stroke a thin crossing stroke is first made, and then shap
with the pen point to meet the stem (see \((i)\) and \((k)\) fig. 146).

We may write out the letters now with their suitable serifs, and we see that the Pen character and finish, given to the "Essential, or Skeleton, forms" (fig. 142) result in a very formal and highly finished alphabet (fig. 147).

**Slanted-pen characters and serifs** (see fig. 145)—

- **a) Hooks or Beaks**
  - Suitable for most of the letters, but tending to be informal.

- **b) Thin Finishing-Curves**
  - Formal and strong.

- **c) Triangular Heads**
  - Formal and suitable for small-letters, and free capitals (see fig. 168).

The alphabets (fig. 148), produced from the skeleton forms (fig. 142) by the slanted pen, while not having such a conscious air of finish as the straight-pen letters, are much easier to write, and have in a greater degree the virtues of strong, legible, natural penmanship.

They are eminently suitable for general MS. work (see p. 305) when the beginner has mastered an arly form of round-hand (see pp. 70, 304).

**DISTINCTIVENESS**

("As having the distinguishing characteristics of each letter strongly marked")

The "**Characteristic Parts**" are those parts which most particularly serve to distinguish one letter from

---

1 Their greater strength may not at first be apparent in fig. 148, as the nib used therefore is narrower, in proportion to the height of letter, than that used for fig. 147 (see also fig. 151).
Good Lettering—
Some Methods of Construction & Arrangement

Formal types of Letters produced chiefly by "Straight" Pen

Fig. 147.
Good Lettering—Some Methods of Construction & Arrangement

Fig. 148.
Good Lettering—Some Methods of Construction & Arrangement

another (fig. 149). We should therefore, when constructing letters, give special attention to their

differentiation (fig. 149). We should therefore, when constructing letters, give special attention to their

preservation, and sometimes they may even be accentuated with advantage—always with an eye to the life-history, or evolution, of the letter in question and allowing for the influence of the special tool with which it is to be made (see Proportion, below also Roman characterisation, p. 280).

250
The right proportioning of letters entails the reservation of their Essential Forms and their characteristic Parts, and, provided these are not
seriously interfered with, a certain amount of exaggeration (and dwarfing)\textsuperscript{1} is allowable in special cases; particularly in ornamental writings, and Penflourished capitals or terminal letters (see figs. 79 and 125).

Rational exaggeration usually amounts to the drawing out or flourishing of tails or free stems, or branches—very often to the magnifying of a characteristic part (see fig. 150, & pp. 250, 331). It is a special form of decoration, and very effective if used discriminatingly.

**BEAUTY OF FORM**

\textit{(As having beautiful shapes and constructions, so that each letter is an individual and living whole (not a mere collection of parts) fitted for the position, office, and material of the object bearing the inscription)}

To choose or construct beautiful forms requires good taste, and that in its turn requires cultivation which comes from the observation of beautiful forms. Those who are not accustomed to seeing beautiful things are, in consequence, often uncertain whether they think a thing beautiful or not. Some—perhaps all of us—have an intuition for what is beautiful; but most of us have to achieve beauty by taking pains.

At the least we are apt to be misled if we label abstract forms as \textit{essentially beautiful} or \textit{essentially ugly}—as by a mistaken recipe for beauty. For us as craftsmen “achieving beauty by taking pains,” means acquiring skill in a special craft and adapting the

\textsuperscript{1} The exaggeration of one part may be said \textit{relatively} to dwarf the other parts of a letter; but it is seldom advantageous, and often not permissible, to dwarf part of a letter absolutely.
skill to a special piece of work. And perhaps the

best way to learn, is to let our tools and materials

teach us and, as it were, make beautiful shapes

for us.

"Inside Shapes."—The beauty of a letter depends
very much on its inside shape—*i.e.* the shape of the
pace enclosed by the letter form. As this is often
verlooked, it may be briefly referred to. Frequently
then it seems difficult to say what is wrong with
a piece of bad lettering, a glance at the inside shapes
will reveal the fault. In *simple writing*, if the pen
is properly cut and properly held, these shapes will
erally take care of themselves, and internal angles

\[ \alpha \]

*Inside shapes: roundness & symmetry.*

\[ \beta \]

*1. S. tend to angularity & asymmetry.*

Fig. 151.

r asymmetrical lines which occur are characteristic
f that particular form of penmanship, and not
ccidental (*b*, fig. 151).
Good Lettering—In making *Built-up* letters—which have both outer and inner strokes—the inner strokes should generally be made first (see p. 121).

Some Methods of Plain and Ornamental Forms.—Not only for the sake of readableness, but to promote a beautiful and dignified effect, the forms of letters are kept simple when the text is long. And, generally, the less frequent the type, the more ornamental may be its form (see pp. 126, 210, 298, 330).

BEAUTY OF UNIFORMITY

*(As the assimilation of the corresponding parts—“bodies,” “limbs,” “heads”—and as the “familiar likeness,” of the different letters, so that they go well together)*

Right uniformity makes for readableness and beauty, and is the result of good craftsmanship.

**Readableness.**—Where the text letters are uniform, the reader is free to give his attention to the sense of the words, whereas the variations in an irregular or changing text are distracting.¹

**Beauty.**—The abstract beauty-of-uniformity may be said to lie in this, that the different letters, as individual elements, “go well together.” The beautiful effect of uniform lettering is thus caused by the united forces, as it were, of all the letters.

**Good Craftsmanship.**—A pen, or other letter-making tool, being handled freely and regularly, the uniform movements of the tool in similar cases will produce uniform strokes, &c. (On the other hand, the interruption and loss of freedom to the

¹ As when the construction of a part of some letter is peculiar (all the y or g *tails*, for example, catching the eye, and standing out on the page), or, as when promiscuous types are used, giving the impression of a confused crowd of letters.

254
riter who is irregular, or who forces an unnatural

ty, results in inferior work.)

**RIGHT ARRANGEMENT**

\[
\text{EAUTY OF ARRANGEMENT} \quad (\text{As having a general fitness in the placing, connecting, and spacing of letters, words, and lines, in the disposal of the lettering in the given space, and in the proportioning of every part of the lettering and its margins)}
\]

The particular fitness of a given inscription depends upon considerations of its particular office, situation, material, &c. (see pp. 100, 351). For general e, however, the craftsman has certain regular odes of disposing and spacing the lettering, and portioning the whole. And, as in constructing idividual letters, so in treating lettering as a whole, endeavours to give his work the qualities that take for readableness: viz. simplicity, distinctiveness, d proportion.

**Simplicity in the Disposal of the Lettering.**—For nvenience of construction, reading, or handling, e simple, traditional arrangement of lettering is nerally followed in dealing with flat surfaces aper, vellum, &c.)

**THE TEXT FORMING A RECTANGLE, CONSISTING OF A NUMBER OF EQUAL LINES**

*Variety.*—There is a variety both readable and beautiful (see 210, 369), but it is founded on uniformity (and sincerity).

"Bands" and symmetrical or asymmetrical groups of letter-adapted to the available space are used—usually as ornament upon friezes, furniture, chests, book covers, flagons, dishes, the like (see fig. 156 & p. 336). The special treatment of h things is a matter for the craftsman who makes them.
Distinctiveness in the Spacing of the Lettering necessitates sufficient interspaces: the following common spacing of Letters, Words, Lines, &c., may be modified to suit special circumstances.

Letters, as a rule, are not equidistant, but their interspaces are approximately equal (a, fig. 152).

Words, commonly one letter-space apart (b and c).

Lines of Capitals, frequently half (d) or whole (e) letter-height apart. Lines of Small-Letters, commonly ascenders and descenders just clearing (f).

Divisions of Text a clear line apart, or marked by a difference in colour or size (see figs. 94, 96, 186, &c.).

Proportion in the Treatment of the Whole Inscription.—The spacing-proportions referred to above apply to lettering generally, but the proportions of an inscription as a whole involve the consideration of a special case. Example:

The Proportions to be Considered in the Case of a Manuscript Book (see pp. 100–108, 341, &c.).

1. Size and shape of the Book and its page (proportion of width to height) (see p. 103).

2. Width of Margins—Proportions—
   (a) to each other.
   (b) to size of page.
   (c) to the lettering.

3. Size of Writing—Proportion of height of letter to length of line.

4. Number of lines—Proportion of text to page.

5. Size of Large Capitals, Initials, &c.

6. Size of Decorative Divisions of the Text (marked by different treatment, colour, ornament, &c.).

Set by custom, use of Book size of material, &c.) (figs. 69, 70, and pp. 101, &c.).

Commonly about $1 \frac{1}{2} : 2 : 3$ (see fig. 70, and pp. 103–)

Frequently about, or more than, half the area of the page.

Set by page, and margin, a number of words in the line usually more than four to the line (see pp. 107–)

Set by page, margin, height-of-letter, and modified by treatment of space (see pp. 108, 262).

Set by Small-Letter; commonly one, two, three, or more of the writing-line-space-high (see footnote, p. 221). Division is relatively small or large—as a definite “heading,” or a whole page (p. 132).
Fig. 152. Good Lettering—Some Methods of Construction & Arrangement.
Good Lettering—
Some Methods of Construction & Arrangement

SETTING OUT, & FITTING IN

Ruling.—The approximate sizes of margins and letters, and the number of lines of text, having been estimated, guiding lines are ruled on the surface (see p. 343)—a right and a left vertical marginal line with the necessary number of horizontals between them. (In the case of a manuscript, these lines are ruled faintly (or grooved), and are left to form a feature of the page; for inscriptions on other materials than paper, parchment, &c., they are generally removed after setting-out.)

Setting-out.—An inscription of any size, or one requiring complex or very nice arrangement, is set out in faint, sketchy outline of lead pencil or chalk. Simple writing is not set-out, but such slight calculation or planning as is necessary is carried out mentally, or on a scrap of paper. By practice the scribe, like the compositor, can fit his lettering to the given space with ease and accuracy. For writing and (to a large extent) printing, both combine setting out and the act of "lettering" in one operation. And this shows how practice gives foreknowledge of the "mechanical" part of the work, leaving the mind free to take pleasure in its performance; and also how slight—if necessary at all—is the experiment setting-out of simple forms required by the practical workman.

Dividing Monosyllables.—In simple writing—the beauty of which depends on freedom rather than precision—I think that even such an awkward word as "through" should not be broken. If the space at the end of a line is insufficient, it should be left blank, or be filled in with a dash of the pen. This is especially in the case of words in LARGE CAPITALS, especially in title-pages and the like, where space...
more difficult, and smooth reading less essential, my word may be divided at any point if the necessity is sufficiently obvious. But (even when the vision is syllabic) breaking words, as interfering

Good Lettering—Some Methods of Construction & Arrangement

Avoiding breaking words; by writing smaller.

MONOGRAMMATICAL TREATMENT: IF THE SPACE DEMANDS IT.

Loops: & Inset Letters: & Tall.

Fig. 153.

with the ease of reading, may often be avoided with advantage, and divisions which give accidentalords, especially when they are objectionable, as
Good Lettering— Some Methods of Construction & Arrangement

“TH-ROUGH,” or “NEIGH-BOUR,” should not be allowed. Among other ways of dealing with small spaces, without breaking words, are the following:—

**Ending with Smaller Letters.**—The scribe is always at liberty to compress his writing slightly, provided he does not spoil its readableness or beauty. Occasionally, without harming either of these, a marked difference in size of letter may be allowed one or more words, or a part of one, or a single letter being made smaller (a, b, fig. 153; see also Plate V.)

**Monogrammatic Forms, &c.**—In any kind of lettering, but more particularly in the case of capitals where the given space is insufficient for the given capitals, monogrammatic forms resembling the ordinary diphthong ΕΕ may be used; or the stem of one letter may be drawn out, above or below, and formed into another (c, fig. 153).

**Linking.**—Letters which are large enough may be linked or looped together, or one letter may be set inside another, or free-stem letters may be drawn up above the line (d, fig. 153, but see p. 26).

**Tying up.**—One or more words at the end of line of writing—particularly in poetry (see p. 95)—may be “tied up,” i.e. be written above or below the line, with a pen stroke to connect them to it (fig. 67).

Care must be taken that none of these methods lead to confusion in the reading. Their “Quainness”—as it is sometimes called—is only pleasing when their contrivance is obviously made necessary.

**“Massed Writing” & “Fine Writing”**

We may distinguish two characteristic modes treating an inscription, in which the treatment of the letter is bound up with the treatment of the spacing (fig. 154).
And if I bestow all my goods to feed the poor, and if I give my body that I may glory, but have not love, it profiteth me nothing.

Love suffereth long, and is kind;
love envieth not;
love vaunteth not itself,
is not puffed up,

Fig. 154.
Good Lettering— Some Methods of Construction & Arrangement

"Massed Writing" (Close Spacing). The written or printed page is very commonly set close, "massed," so that the letters support and enforce one another, their individual beauty being merged in and giving beauty to the whole. The closeness of the letters in each word keeps the words distinct so that but little space is required between them and the lines of writing are made close together (ascending and descending stems being shortened, if necessary, for this purpose).

"Fine Writing" (Wide Spacing).—An inscription in "Fine Writing" may be spaced widely to display the finished beauty of the letters, or to give free play to the penman (or letter-craftsman). It consists generally of a number of distinct lines of Writing (or other lettering).

The two modes may be contrasted broadly, thus—

**MASSED** {Lines near WRITING together. Has an effect of richness, depending on tone of mass and close, even spacing.

Simple method (for ordinary use); saving of time and space, .: suited for long inscriptions or small spaces.

Lines generally of equal length, or if some fall short, end-fillings may be used—gaps are avoided if possible.

**FINE** {Lines space WRITING and separate. Has an effect of elegance, depending on form of letter and distinct arrangement lines.

Refined method (for special use); lavish of space and time, .: suited for large spaces or short inscription.

Lines may be of unequal length, giving irregular right-hand edge, as in poet (see p. 263)—gaps allow on either side.

1 By closing up the letters and the words one may generally avoid "rivers" or accidental spaces straggling through the text. The presence of "rivers" is at once made evident by slanting the page and looking along its surface, across the lines. Note, that whether the lines be close or wide, the interspacing of the Small Letters does not vary very much.
Ascending and descending stems — medium or short: serif simple, and not strongly marked.

Suited for slanted-pen forms of “gothic” tendency, and heavy, black writing (example, “black letter”).*

Requires generally contrasts of colour or weight (p. 330), and will bear more and heavier illumination (Line-fillings, Initials, Borders, &c.).

* Note.—Both modes are suited for Roman Capitals and Small-Letters.

These two modes may not have been recognised by the ancient letter-craftsmen: their comparison here is intended chiefly as a stimulus to definite thought, not as a hard-and-fast division of two “styles”; for there may be any number of possible compromises between them. In practice, however, it will be found convenient to distinguish them as two modes of treating lines of writing which produce markedly different effects, the one, as it were, of colour, the other of form.

Plates XI., XIII., XIV., XV., XVII. may be taken as examples of “Massed Writing,” Plates IV., V., VI., VII., IX., (XXI.) of “Fine Writing”; the other plates suggest compromises between the two.

Poetry (see p. 95), or any text consisting of, or which is conveniently broken up into unequal lines, may be treated as “Fine Writing.” There is no objection to a straight left-hand edge with an irregular right-hand edge,¹ where the cause of the irregularity

¹ The gaps on the right may be filled with line-finishings to preserve a “Massed” effect, but for many purposes this would be apt to look too ornamental (see pp. 205, 423).
Good Lettering— Such an arrangement, or rather, straightforward writing, of poetry is often the best by virtue of its freedom and simplicity (see p. 371).

Methods of Construction & Arrangement In many cases, however, a more formal and finished treatment of an irregular line text is to be preferred (especially in inscriptions on stone, metal &c.), and the most natural arrangement is then an approximately symmetrical one, inclining to “Fine Writing” in treatment. This is easily obtained in inscriptions which are previously set-out, but a good plan—certainly the best for MSS.—is to sort the lines of the text into longs and shorts (and sometimes medium lines), and to set-in or indent the short line two, three, or more letters. The indentations on the left balance the accidental irregularities on the right (fig. 154, and Plate IV.), and given an appearance of symmetry to the page (see Phrasing, p. 384).

Either mode of spacing (close or wide) may be carried to an unwise or ridiculous extreme. “Leading” the lines of type was much in vogue a hundred years ago, in what was then regarded as “high class” printing. Too often the wide-spaced line and “grand” manner of the eighteenth-century printer was pretentious rather than effective: this was partly due to the degraded type which he used, but form, arrangement, and expression all tended to be artificial. Of late years a rich, closely massed page has again become fashionable. Doubtless there has been a reaction in this from the eighteenth century to an earlier and better manner, but the effect is sometimes overdone, and the real ease and comfort of the reader has been sacrificed to his rather imaginary æstheticism.

By attaching supreme importance to readablenes
EVEN SPACING

In the spacing of a given inscription on a limited surface, where a comparatively large size of letter required, what little space there is to spare should generally be distributed evenly and consistently (a, p. 155). Lavish expenditure of space on the margins would necessitate an undue crowding of the lettering (b), and wide interspacing would allow sufficient margins (c)—either arrangement suggesting inconsistency (but see p. 352).

Note.—A given margin looks larger the heavier the mass of the text, and smaller the lighter the mass of the text. And, therefore, if lettering be spread out, in “Fine Writing,” the margins should be extra to have their true comparative value. The pace available for a given inscription may in this largely determine the arrangement of the lettering, comparatively small and large spaces suggesting respectively “Massed Writing” and “Fine Writing” (see p. 262).

In certain decorative inscriptions, where letters are merely treated as decorative forms—readableness

---

1 In (b) fig. 155, the letters have been unintentionally narrowed. The natural tendency to do this forms another objection to such undue crowding.

2 In (c) the letters have been unintentionally widened.

3 Experiment.—Cut out a piece of dark brown paper the actual size of the body of the text in an entire page of this handbook, viz. 5\(\frac{1}{2}\) inches by 3 inches, and lay it on the text: tone of the brown paper being much darker than that of the print makes the margins appear wider.

being a matter of little or no moment—the treatment of the spacing is adapted to a particular surface; and, or example:

**THE LETTERS MAY BE KEPT VERY CLOSE, FORMING ORNAMENTAL BANDS, THO' THE LINES MAY BE WIDELY SPACED AND LEGIBLE.**

**OR THE LETTERS MAY BE FAR APART & THE LINES CLOSE, TO COVER SURFACES.**

---

**FIG. 156.**

**THEORY & PRACTICE**

The above discussion of theories and "rules" for the construction and arrangement of good lettering is intended to suggest some useful methods—not to provoke excessive fitting or planning, but rather to void it. Straightforwardness is perhaps the greatest virtue in a craft, and whatever "rules" it may break through, it is refreshing and charming.

An excellent example for the scribe or inscription maker is the method of an early printer, who had only four or five sorts of type—say, "Small-Letters" and "Capitals" (Roman and Italic) and "Large Capitals," and who, without any elaborate "design," simply put his types into their proper places, and then...
pulled off his pleasant sheets of “commonplace’ printing.

The scribe should choose the best and simplest forms and arrangements, and master them before going further; he should have a few definite types “at his finger tips,” and, for everyday use, a matter-of-course way of putting them down on paper.

Ambiguity is one of the greatest faults in a craft. It comes often from vague ambitions. One may be inspired by good ambitions, but the immediate concern of the craftsman is to know what he is capable of doing at the present, and to do it.

Let the meaning of your work be obvious unless it is designed purely for your own amusement. A good craftsman seeks out the commonplace and tries to master it, knowing that “originality” comes of necessity, and not of searching.

CHAPTER XV
THE ROMAN ALPHABET & ITS DERIVATIVES

The Roman Alphabet

The Roman Alphabet is the foundation of all other alphabets (see Chapter I.). And since the f
development of their monumental forms about 2000 years ago, the Roman Capitals have held the supreme place among letters for readableness andauty. They are the best forms for the grandest most important inscriptions, and, in regard totering generally, a very good rule to follow is: *then in doubt, use Roman Capitals.*

The penman may with advantage devote some stud to a fine monumental type of Roman Capital such as that of the Trajan Column Inscription: (plates I. and II.), and endeavour to embody its tues in a *built-up pen form* for use in MSS. (p. 294).

**PROPORTIONS OF LETTERS: WIDTHS**

The marked distinction between the “Square” and the “Round” forms, and the varying widths the letters—as seen in the early inscriptions, characteristic of the Roman Alphabet. We may boldly distinguish Wide and Narrow letters thus—

```
<table>
<thead>
<tr>
<th>WIDE</th>
<th>ARROW</th>
</tr>
</thead>
<tbody>
<tr>
<td>{ O Q C G D }</td>
<td>{ B E F R S Y (X) }</td>
</tr>
<tr>
<td>{ M W }</td>
<td>{ I J }</td>
</tr>
<tr>
<td>{ H (U) A N V T (Z) }</td>
<td>{ K L P }</td>
</tr>
</tbody>
</table>
```

"Round."

"Square."

Such inscriptions contrast favourably with that Nineteenth century style in which it was customary to make every letter upy the same space and look as much like its neighbour as possible.
The Roman Alphabet & its Derivatives

The "Round" Wide Letters—O, Q, C, G, D may be regarded as the Key letter of the alphabet. Given an O and an I of the alphabet, we can make a very good guess at the forms of the other letters. In fine Inscriptions the external line of O is commonly an almost perfect circle (see Plate II), i.e., its height and width are equal. This may be regarded as the ideal shape, though a slight widening or narrowing of the letter (fig. 157) is permissible.

Note.—There is less danger of spoiling letters by narrowing them than by widening, because the limits to the possible narrowing of a letter are more obvious than the limits to its possible widening. Further, when letters are widened, there is a tendency to thicken their parts and make them heavy and vulgar.
ry nearly, and, though C, G, D are a little narrower, they have the same effect of roundness and

The "Square" Wide Letters—M, W, and H, A, N, V, T, (Z)—

M & W Their mean width is properly about equal to their height.

H Width equal to, or a little less than, height (fig. 158), but if made too narrow it would look heavy, being double-stemmed.

I (see pp. 287, 284) resembles H.

A, N, & V are double-stemmed, and have internal angles, moreover, which would become too sharp—and tend to close

Approx. imately

width & height equal. narrower.

Wide forms A, N, & V, and dangers of too sharp angles. (Wide and narrow Z.

FIG. 158.
The Roman Alphabet & its Derivatives

The cross-bar—the characteristic part of T—projects a fair way on either side of the stem.

Either wide or (moderately) narrow (fig. 158).

The Narrow Letters, B, E, F, R, S, Y (X) (see fig. 159).

There is a point of division in these letters about the middle of the stem or a little above (see p. 273 and we may argue that each being composed, as were, of two little letters—which are half-height they are proportionate half-width: and this will be found approximately correct. B may be said to consist of one little D on the top of another, averaging respectively half the height and width of full-sized D.

E, F, & R follow the proportions of (see also E, 4, p. 282).
may be made of one little tilted O on the top of another—joined together and having the superfluous parts removed.

Y is like a little V upon a little I.

X

Either narrow or wide (fig. 159).

The Narrow letters, K, L, and P—

These forms are related to the B, E forms, but is permissible to make them a little wide to give earance to the angles of the K and force to the angle arm and loop—the characteristic parts (see § 149)—of L and P.

UPPER & LOWER PARTS

In the letters B, E, H, K, X (A), F, R, P (S), there is generally a tendency to enlarge the wer part, the cross-bar—or division—being set ove mid-height. This tendency may reasonably accounted for as follows:—

The natural division of B, E, H, K, & X, regarded as abstract forms, would symmetrical—i.e. at the centre of the stem. In order that its apparent position may be central, ever, it is necessary, for optical reasons, to make

The primitive forms of these letters were vertically symmet- al, I believe.
The Roman Alphabet & its Derivatives

its actual position above the centre. And further by a reasonable enlargement of the lower part, these letters acquire a greater appearance of stability.

It would be well, I think, for the letter-craftsman to begin by making such divisions at the apparent centre (i.e. very slightly above mid-height; see E, F, X, Plate II.), so keeping most nearly to the essential forms (see p. 275). Later he might consider the question of stability (see B, Plate II. The exaggerated raising (or lowering) of the division associated with “Art Lettering” is illegible and ridiculous.

A

The lower part is essentially bigger, and the cross-bar is not raised, as that would make the top part disproportionately small.

F

usually follows E, but being asymmetrical an open below it may, if desired, be made with the bar at—or even slightly below—the actual centre.

R

In early forms the bow was frequent rather large (see Plate II.), but it is safer to make the tail—the characteristic part—more pronounced (see Plates III., XXIV.).

P

The characteristic part of P is the bow which may therefore be a little larger than the bow of R (see Plate III.).

S

In the best types of this letter the upper and lower parts are approximately equal; there is a tendency slightly to enlarge the lower.

1 It is interesting to note in this connection that the seems to prefer looking upon the tops of things, and in reading is accustomed to run along the tops of the letters—not do one stroke and up the next. This may suggest a further reason for smaller upper parts, viz. the concentration of as much of letter as possible in the upper half.
ESSENTIAL OR STRUCTURAL FORMS

The essential or structural forms (see p. 240) are the simplest forms which preserve the characteristic structure, distinctiveness, and proportions of each individual letter.

The letter-craftsman must have a clear idea of the skeletons of his letters. While in every case the precise form which commends itself to him is matter of his individual choice, it is suggested in the following discussion of a typical form—the Roman—that the rationale of his selection (whether conscious or unconscious) is in brief to determine what is absolutely essential to a form, and then how this may be amplified in the direction of the practically essential.

The letter B reduced to its simplest (curved-bow) form—i.e. the bare necessity of its distinctive structure—comprises a perpendicular stem spanned by two equal, circular bows (a, fig. 160).

In amplifying such a form for practical or aesthetic reasons, as well as a rule not to exceed one's object—in this case to determine a reasonable (though arbitrary) standard essential form of B, having a distinctive and proportionate (f) structure, we may increase the arcs of the bows till their width is nearly equal to their height (b), make their outer ends meet the ends of the stem (c), and their inner ends coincide (d). Raising the division till its apparent position is at or about the middle of the stem entails a proportionate increase of width in the lower part, and a corresponding decrease in the upper part (e).

The very idea of an essential form excludes the unnecessary, and its further amplification is apt to take from its distinctiveness and legibility. Where
The Roman Alphabet & its Derivatives. No limits are set, modification is apt to become exaggeration. And, though special forms and
ornamental letters may be produced by "reasonable exaggeration" (k, l, m, fig. 161), if the tool be kept

Note:

a larger degree of
exaggeration is permissible in Ornamental Forms.

FIG. 161.
The Roman Alphabet & its Derivatives under proper control, yet, generally, such structural changes do not improve the appearance of the plan letter forms.

We may test our “Standard” (a, fig. 161) by considering the effects of further amplification.

1. Raising the division slightly is permissible (b, fig. 161) too much makes the top part disproportionately small (c).

2. Widening both bows, or separating their junction from the stem, tends to dissociate the bows from the stem, making the letter less distinctive (g and i, fig. 161).

Widening and narrowing are both allowable and occasionally desirable, but assuming that a standard or ideal width can be approximately determined, it is well to keep to it for common and ordinary use.

CHARACTERISATION OF FORMS

(See also Built-Up Forms, pp. 291–6, and pp. 240, 252)

That the tool gives character and finish to the Essential Forms of letters, can easily be proved by a little practical experience of the natural action of a properly cut pen (see figs. 142 to 148, and 162 to 168). And the penman—or indeed any other letter-maker—is advised to allow the pen to train his hand.

1 The extremely beautiful and finished B in the “Trajan Alphabet” (Plate II.) has the division a little higher, and marked enlargement of the lower part; until the letter-craftsman can approach the perfection of its execution he will find a simpler form more suitable for his “standard.” A curious form, in which the top lobe has nearly or quite disappeared (comp. c, fig. 161), is found in early Roman inscriptions. This form (which may have helped to give us the useful small b) is not suitable for a modern Capital, and would lack the distinctiveness of B.

2 Chisel-made Roman Capitals (possibly influenced by brush &c., pp. 292, 391), Plates I., II.: (modern), XXIV. Pen-made Plates III., XVIII.: (modern), figs. 147, 148, 167, 168, &c.
The Roman Alphabet & its Derivatives

THE CHARACTERIZATION OF THE LETTER B.  
BY MEANS OF PEN STROKES

FIG. 162.
make the proper strokes automatically: then he may begin to master and control the pen, making it conform to his hand and so produce Letters which have every possible virtue of penmanship and are as much his own as his common handwriting.

Most of the letters in a good alphabet have specially interesting or characteristic parts (p. 250), or they exhibit some general principles in letter making, which are worth noting, with a view to making good letters, and in order to understand better the manner in which the tool—whether pen, chisel, or brush—should be used.

The characterisation of the Roman Capital Form.

Note.—The large types below are indices—not models.

A

1. A pointed form of A, M, and N (see Plate II.) may be suitable for inscriptions in stone, &c., but in pen work the top is preferably hooked (fig. 167), beaked (fig. 147), or broken (fig. 158), or specially marked in some way, as this part (both in Capital A and small a) has generally been (fig. 189).

2. The oblique strokes in A, K, M, N, R, V, W, X, Y, whether thick or thin, are naturally finished with a short point inside the letter and a long, sharp point, or beak, outside (see serifs of oblique strokes, p. 289).

3. The thin stem may be drawn out below for an occasional form (see F, 3).

B

2. B, D, E, F, P, R (and T) have generally an angle between the stem and the top horizontal, while
3. *below* in B, D, E (and L) the stem curves or ends with the horizontal.

4. See O, 2.

1. C, G, (and *round* E) may have the top horizontals or ‘arms’ made straighter than the lower arms (see fig. 187).

2. C, G, S, &c.; the *inside* curve is generally best continuous—from the ‘bow’ to the ends of the ‘arms’—not being broken by the tops (except in special forms and materials), and

3. it is best to preserve an unbroken inside curve the termination of all free arms and stems in built-up Roman Capitals. In C, G, S, E, F, L, and Z the upper and lower arms are curved on the *inside*, and squared or slightly pointed outside (the vertical stems curve on either side) (fig. 163).

4. ‘Arms’ are best shaped and curved rather actually out to the terminal or serif, which then is the actual part of the letter, not an added lump (289).

5. See O, 2.

---

The Roman Alphabet & its Derivatives

---
forms: the lower serif of this type commonly point
out (see figs. 206, 188).

4. E's three arms (& F's two) are approximately
equal in length in the best early forms (Plate II., &c.)

F

1. See B, 2.
2. See C, 3 and 4 (and E, 4 above).
3. The development and traditions of each
class of letters being considered, nearly all of the
occasional forms (see fig. 188).
4. The elongated stems of F, I, J, P, T, Y may
hang below the line, or they may (occasionally)
stand on the line and overtop the other letters.

G

1. See C, 1, 2, 3, and 4.
2. The stem may be drawn out below the line (F, 3).
3. The stem sometimes forms an
angle with the lower 'arm' (this
safest: see fig. 148), sometimes they blend (fig. 147).
4. The point of the lower 'arm' may project
very little beyond the stem to mark the outer angle.
5. The round "gothic" G (as also the other
"round" letters: p. 119) may generally be used
freely together with the "square" Roman Capital.

H

1. The left-hand stem is occasionally
drawn out above (F, 3 & comp. fig. 3), at
2. this form is sometimes associated
with an ornamental cross-bar (fig. 189).
3. H and N may slightly widen out

above.

282
I. The stem may be drawn out above (see Plate XXIV.) or below (F, 3 and 4).

2. See J, 2.

J. The stem or tail may be drawn out (F, 3 and 4).

2. Note.—With regard to the use of I for J (and V for U):¹ this—the classical Latin usage—is correct (for the capital forms) in a modern Latin inscription. But for modern English, in which these letters are strongly differentiated, the tailed J and the round U are to be preferred. Besides the suspicion of affectation attaching to the other mode, its strangeness gives an appearance of awkwardness—almost amounting to illegibility—to common words, such as “A QVAINT IVG” or “IAM IAR.” And, at the least, very careful

¹ J. C. Egbert in an “Introduction to the Study of Latin Inscriptions” says, “J was not specialised as a letter until the 15th Century.” It would seem that in early inscriptions a tall I was frequently used for J between vowels, and for I at the beginnings of words: later, while the medial I remained straight, the initial form was curved to the left and used for both I and J; this curved initial form, J, at length became identified with the letter J.

Similarly, it appears that V was used for an initial, and U for a medial; and later, the V form became identified with the consonant.

In the words In vici, natiu in fig. 95, the initial I is curved like a J, while the medial i’s are straight; the initial V has a v form, while the medial V in natiu(natis) has a u form.
discrimination is desirable: “IVBILATE” may pass, but “IVIVBE” is not really readable.

3. The tail of the J may be slight, provided it be distinct, and the second stem of the U may match the first (fig. 158); the ugly J and U in common use need not be copied.

4. See also Tails, pp. 289–291.

K

1. The stem is sometimes drawn out above (F, 3).

2. Both arms are occasionally lengthened, and the width of the letter increased by joining the thin arm to the stem low down; the thick arm, or tail, then springs from the side of the thin arm (compare R). This tends away from the essential, and is therefore less safe form.

3. The tail may be curved or drawn out occasionally (see Tails, pp. 289–291).

L

1. See B, 3.

2. See C, 3 and 4.

3. See E, 3.

M

1. The stems are commonly slight spread out to give greater clearance for the inner angles. An occasional form is widely spread M. The v part being shortened M, or widened M, has a like effect.

2. Note.—There are inscriptional forms of 284
and N without the top serif (Plate II.). But the
other forms and others have top serifs, and these
commonly extend outward—tending to beaks (see
8, 1 and 2)—rather than in. (V, W, X, Y (and
1) show a similar tendency—see p. 289.)
3. The thin stem of M is occasionally drawn
out (F, 3).

2. See H, 3.
3. See M, 2, and A, 1 and 2.
4. The first stem is drawn out below
the line for an occasional form (most suit-
able for an Initial Letter): the right-hand stem is
very occasionally raised (when a final letter) (F, 3).
5. Note.—The stems of N (the only vertical
ins—not counting M’s—in the Roman Capitals)
and sometimes to be thicker: see Plate II.

1. O is the key letter of the curved
forms and, in a sense, of the whole alphabet (p. 270). The upright form—
O—may be regarded as the ideal
mple letter.

2. Very commonly, however, O is tilted—O
—(see fig. 163), and when this is the case, all the
urred letters—B, C, D, G, P, Q, R, S, U—are
espondingly tilted (see Plate II.). The tilted form
more easily made, but both are good forms.

1. See B, 1 and 2.
2. See O, 2.
3. (P with stem below line (see Plate
IV.) must not be allowed to confuse with
D) (see F, 3 and 4).
4. The bow of P appears to be attached (to the stem) above: in certain forms it is slightly separated from the stem below: see Plate II.

Q

1. Q resembles O with a tail: see O.
2. There are many characteristic varieties of the tail: see Tails (pp. 289–291).
3. Note.—Q being always followed by U, it is convenient often to deal with the two letters together. (See Plate II.)

R

1. See B, 1 and 2.
2. See O, 2.
3. In the form nearest the essential, the junction of the Bow and the Tail touches the stem. If the tail springs from the curve of the bow (Plate II.) greater care in construction is necessary (compare K). The treatment of the tail is very important. It may end in a serif (see A, 2), or it may be curved and pointed (see Tail pp. 289–291). It may be drawn out (see fig. 150).
4. See F, 3 (& conf. fig. 169).

S

1. See C, 2, 3, and 4.
3. S very often leans slightly forward.

T

1. See B, 2.
2. See C, 3 and 4.
3. Drawing out of stem: see F, 3 and 4.
4. Note.—The right arm is occasionally extended—to fill a line—when T is terminal letter (in this case it is generally milder, and the left arm heavier—somewhat as the Uncial T, figs. 56 & 188).
1. Note.—The curve—if it be modeled on the common tilted O (see O, 2)—is thin where it meets the second stem.
2. (V for U). See J, 2, 3, and footnote.
3. The foot of the second stem projects the right only, and gives clearance to the angle the curve on the left. Sometimes the second stem ends in a hook or beak, which (very occasionally) is drawn out below.

1. See M, 2, and A, 2.
2. The thick stem may be drawn up (F, 3), in which case the thin commonly curves over for strength (see figs. 89, 95).
3. (See note on V for U, under J.)

1. See M, 2, and A, 2.
2. The best form is of two V’s crossed, W.

1. See M, 2, and A, 2.
2. There is sometimes a slight curving in of the stems, especially the thin stem (see fig. 80).
3. The thin stem is sometimes drawn below (F, 3), and commonly curved.

1. See M, 2, and A, 2.
2. See F, 3 and 4. (Y with stem below line (see Plate V.) must not be allowed to confuse with V.)
3. An occasional rather interesting form
The Roman of Y has the arms curving out and ending in poi
Alphabet (see fig. 167).
& its Derivatives

Z

2. The lower arm of Z is sometimes drawn out (see E, 3): it may be curved and pointed (or flourished).

General Remarks on the characterisation of Roman Capitals and related forms, illustrated in fig. 163.

VERTICAL STEMS.—(a, fig. 163) Thick (excepting in the thin stemmed N (and M)).
(b) Slightly curved in on either side (see fig. 111) or appearing so because of the outward curve of serifs (see figs. 204, 206).
(c) A fine effect is obtained when the stem made wider above than below (see p. 119).
(d) Free stems occasionally are drawn out above, F, 3 and 4, and pp. 251, 260, 332).

OBLIQUE STROKES or STEMS.—In A, &c., from the left \ thick, to the right / thin otherwise like vertical stems (above), see serifs (e) (below).

HORIZONTALS, ARMS, BRANCHES, BARS.—Thin: free ends sometimes drawn and flourished (see figs. 125, 188).

BOWS and CURVES.—Gradated, and following the O (see pp. 44, 121, 270, 285).

SERIFS or FINISHING STROKES.—

Note.—Serifs of some sort are practically essential to the proper characterisation of an alphabet (figs. 147, 148, 162), and should generally have certain uniformity (p. 324).

1 The more ornamental treatment of Stems, Bows, Serifs, T &c., is referred to at p. 331, and in figs. 188, 189.
(b) The serifs, &c., of simple-written forms are stated at p. 244 (see fig. 145).
(c) In *Versals* and certain other forms the mode making requires the serif to be a distinct addition to the letter (see figs. 116, 166).

(d) In the finest built-up A B Cs serifs are treated as the actual finishing and shaping of the tips of the *stems and branches*, rather than as added parts (see C, 3 & 4, p. 281 and p. 240). This particularly affects the construction of the thin strokes (see figs. 165, 167).

(e) The serifs of the oblique strokes in A, K, M, N, V, W, X, Y are commonly not placed centrally, but projecting in the direction of the stroke (i.e. away from the letter, thus: \( \times \)), branching out from the parent stem (see *tails*, below), and avoiding an acute angle (as \( \backslash \)). This has tended to produce *hooks* and *beaks* (see fig. 163), which are often used for the oblique strokes, particularly of A and N (see figs. 189, 158), and the tails of K and R (see below).

(f) There is a similar natural tendency to *hook flourish* the terminals of *vertical stems* on the left, particularly of B, D, I, J, K, L, P, R; less often E, F, H. A very interesting and beautiful effect may be obtained by delicately curving down the upper serifs on the *left* (like thin *beaks*). Such serifs are sometimes very slightly *turned up on the right*, and it may be noted that this tendency of the *horizontals* to *curve up and forward* — is natural and characteristic of freely made, vigorous lettering (see Uncial T, pen dashes, &c., figs. 169, 15, &c.).

**TAILS.** — (a) The tails of K, Q, R (and J) —
The Roman Alphabet & its Derivatives

Fig. 163.
The strokes in A, F, G, I, M, N, P, Y, &c., which may be drawn out tail-wise—play an important part in the right construction, and the occasional decoration, of plain lettering. They may either in serifs or in curves (see SERIFS (e), fig. 188).

b) Note.—It is a characteristic of vigorous forms that branches, &c., stand out well from their stems (219, (e) 289, (N) 271), and a good tail should stand out well from the letter (K, Q, fig. 167).

c) An excellent form of tail for ordinary use, combining strength and grace, consists of a (strong) light stroke ending more or less abruptly in a graceful finishing curve.

d) An extraordinarily long tail requires a slight double curve to take off its stiffness.

e) A good tail may be made by the addition of a double curved stroke on the under side of a light tail (or of a single curve above).

f) In treating the tail of J, or the drawn-out stems of A, F, G, I, M, N, P, Y, it is important to preserve the essential straightness of the stems. Therefore, if a finishing curve be used, its size is limited to the length of the straight stroke, and, unless this be extraordinarily long, the curve is usually made rather small and abrupt. A curve which is too large is apt to weaken the form and pull it out of the straight” (g, fig. 163).

BUILT-UP FORMS

Built-up Letters are composed of compound strokes (c, d, fig. 164); Simple-written Letters of multiple strokes (a, b).

The Pen being an instrument which produces
definite thick and thin strokes on a smooth surface, perfectly adapted to the construction of either simple or compound forms; other tools, such as the stylus needle, graver, &c., produce various scratches, stitches, or cuts, generally of the nature of rather varying thin strokes, and to produce thick strokes a building-up process is required.

In making built-up forms the control exerted by the tool is less obvious, and more depends upon the craftsman, who must therefore use greater care and judgment. Not only is it possible, but, occasionally, it may be desirable to depart from the more obvious tool-forms; though generally the more simply and naturally tool-made a form is, the better it is.

The fine early inscriptions are supposed to have been first drawn or painted (in outline) and then cut into the stone. The chisel forms were doubtless affected in this way by brush (and indirectly by pen) forms, but these were of the simplest—nothing was sketched in that was unfitted for the chisel to make into a natural and true chisel-form.

The action of the brush or "pencil" to a certain extent resembles that of the pen, but their effects are really distinct. In contrasting pen-made and brush-made letters, we may observe that a pen tends to abrupt changes from thin to thick: a brush for gradation (fig. 164). The pen particularly affects curved strokes (comp. a & b), generally making them more quick and abrupt (or even broken, see ** than brush curves. The brush will give more graceful and finished but less uniform letters (s. p. 376).

The character of a pen-letter depends greatly on the nib-width (p. 324), and narrow, medium
Simple-written PEN curves

Built-up PEN Letter

BRUSH made

Fig. 164.

broad nibs are used according to the type of letter required.

A narrow nib may be used for special (built-up) initials and Capitals, which are drawn rather than written (a, fig. 165). The horizontal arms (made by the pen held horizontally) are markedly affected, and if a very fine nib were used, the necessity of strengthening and thickening them would tend further to reduce the pen character.

A broad nib gives strong, uniform pen-letters (b).

For ordinary use letters are perhaps best made with a "medium" nib (c).
The Roman ordinary writing-pen, or rather narrower, gives a good proportion for initials, &c. (see pp. 118, 218).

In MS. books the early built-up Capitals were commonly of a rather severe type—approaching the Roman Capital, but having the sharp contrast between the \textit{thicks} and the \textit{thins} characteristic of pen-letters (fig. 166). They make very simple and effective "Versals."

A more highly finished type of pen-made Roman Capital may be made by blending the serifs and stems (\textit{d}, p. 289): it is nearer to the inscription.
Fig. 166.—Pen-capitals from a tenth-century MS. (writing-lines dotted in fig. to show spacing method).
The Roman form, but it exhibits a more curved and suppl
Alphabet outline, which comes of natural pen-strokes (fig
& its 167).

The remarks in Chapter VII. on the treatment of the more elastic "Gothic" Versal (a free varie
296
f the Roman) may be taken as applying generally
(Coloured) Built-up Capitals — due allowance
being made for the characteristic differences of the
arious types.

SIMPLE-WRITTEN CAPITALS

"Rustic Capitals" (fig. 4) may be referred to here
as typical, simple-written capitals. Though not a
ery practical form,¹ they are full of suggestions for
semi-ornamental lettering in which the pronounced
treatment of the heads and feet might be a feature
comp. (fig. 203). They were used as ornamental
letters for titles and the like (see Plates VIII., IX.,
ec.) for centuries after they had gone out of ordinary
ise.

Simple-written Roman Capitals. — (Examples:
plates III., XVIII., XIX., XXI., figs. 147, 148,
68, 175, 179. See also pp. 247, 429.)

Uncials.—(Examples: see p. 300.)

Simple-written Capitals ordinarily conform to
the writing line—as set by the small text (p. 82).
This applies even where several words in capitals
have to be inserted in the small text, though in
special cases where these might look too crowded
such capitals might be written on alternate lines.

Used for Initial Words, headings, whole pages, or
books, in black or colour, they are written with
greater freedom and accorded more special treatment
(as indicated below).

Simple-written Capitals are best composed of
sharp, clean, pen-strokes: they may be quite plain

¹ Their thin stems and heavy branches may tend to weakness
and illegibility—e.g. such letters as E, F, I, L, and T (see
fig. 4) are not always easily distinguishable.
The Roman Alphabet or more or less decorative (fig. 168), subject to the general rule that the fewer the number of letters or the more ornamental their office, the more elaborate a fanciful may be the forms employed (see p. 330).

Derivatives fanciful may be the forms employed (see p. 330).

Simple-Written Capitals: roughly copied from Plate XVIII.

Fig. 168.

A freely used pen naturally produces occasional varieties for special or ornamental purposes: they tend to elegance and drawn out flourished strokes (p. 331); they vary chiefly in being extra large.

1 Increasing the size of letter affects the form as though they were narrowed (see p. 324).

298
several of these may be used with fine effect in a page of plain Capitals, their “weight” (and generally their colour) being the same as that of the text (see Plate V., and p. 328).

Whole Books or Pages written in Capitals.—A very grand effect may be produced by these at the expense of a little more time and material than a Small-letter MS. entails. The lines of writing are commonly made one-letter-height apart: this requires ordinary simple ruling—the capitals being written between every alternate pair of lines (see p. 412).

Such writing may conveniently be treated as Fine Writing” (p. 262). It justifies the use of wider margins. It is generally more difficult (and less necessary) to keep the right-hand edge as straight as a small text permits. The irregularities of this edge may be balanced by setting out in the left margin the first letters of sentences, verses, and the like (see p. 264). Such initials may be written larger or more ornamentally as suggested above; or, if built-up Letters are required, plain, rather slender Roman Capitals are the most suitable: these look best in burnished gold.

Perhaps the finest and most beautiful work which the penman can produce, is a book written entirely in gold\(^1\) capitals\(^2\) on purple vellum (see pp. 164, 175). This is only possible in special cases, but a book lightly so made being illuminated from within, has incomparable simplicity and grandeur, surpassing that of the finest post-decorated and illuminated manuscripts.

---

1 Some may be in “silver” (p. 165).
2 In a very short book these might even be built-up capitals.

299
The Roman Alphabet & its Derivatives

Examples: Plates IV., V.; figs. 5, 169 (enlarged (modified, fig. 56).

Uncials are typical pen-capitals. Though not of such practical use as the simple-written Roman Capitals, their great possibilities and their beauty make them worth practising. (See Round, Upright Formal Hands, p. 304.)

Their use is limited by two considerations—

First: that while the round δ,ε,θ,μ,τ are essentially legible (p. 239), people generally not accustomed to them, and may find them hard to read; and

Secondly: that θ,φ,χ,β,κ,λ,π,ρ,Ω have ascending and descending strokes which are apt to become too pronounced and give an unpleasant appearance of “tailiness” to a page. Uncial Writing (in English, see footnote, p. 326).

The first difficulty may be met by keeping Uncials for special MSS.—for private use—and introducing them sparingly or not at all in Service Books, Placards, &c., where ease and quickness of reading are essential.

The appearance of “tailiness” (not so obvious in Latin) may be avoided by making the tails short and keeping the lines of writing well apart. Freely made Roman Capitals without tails (see tail-less, fig. 57) may be substituted for one or more of the chief offenders.

1 Palæographers call them “majuscules” (= “large letter but distinguish them from “Capitals.” For the purpose of the modern penman, however, they may be regarded as Roman Capitals. (For their treatment, see pp. 297–299, and 304.)
Proximum autem

Pascua ludaeorum

Elyan d geregone ant

Fig. 169.—Part of Plate V. (q.v.), enlarged three times linear

The Roman Alphabet & its Derivatives
The Roman Alphabet & its Derivatives

Uncials may be “round” (see Plate IV., fig. 5, and p. 304), or “pointed” (see fig. 169 and p. 413).

CAPITALS & SMALL-LETTERS

During the development of Small-Letters from Capitals but little distinction was made in their use, and such capital forms as n and r were freely and promiscuously used in the round minuscule writings, together with the small-letters n and r (see Plates VI., VII.). On the other hand, Small-Letter forms were frequently written larger and used as initials. In Irish and Anglo-Irish MSS. these were filled inside with green, yellow, or red, and surrounded outside with red dots, or otherwise decorated with colour (see fig. 7, and Plate VI.).

In early MSS., therefore, one does not find an alphabet of Simple-Written Capitals, which is peculiar to a given small text. But we may employ a kindred capital—such as the round Uncial for the round Half-Uncial. And a fitting alphabet may always be constructed, from the “Roman” or “Uncial” types of Capitals (footnote, p. 300), by taking the same pen with which the small-letters have been made and using it in a similar manner: “straight” for “straight-pen” writing, and “slanted” for “slanted-pen” writing (see figs. 147, 148).

When in doubt as to the type of Capital—for any purpose—use Roman Capitals.

EARLY, ROUND, UPRIGHT, FORMAL HANDS

Examples: Half-Uncials—fig. 6 (Roman); Plate VI. (Irish), Plate VII. (English) fig. 170 later; see also pp. 40, 44, 413-415. Uncials (Plate IV. and p. 38).

302
The Roman Alphabet & its Derivatives

G. 170.—Part of an English eighth-century MS. (British Museum, Case C, No. 68), enlarged three times linear.
The main types are the "round" Uncial and Half-Uncial, commonly written with an approximately "straight pen."\(^1\) They are generally treated as fine writing (p. 262), and written between rule lines: this has a marked effect in preserving the roundness (see p. 414).

They are very useful as copy-book hands (see p. 70 for though the smooth gradation of their curve their thin strokes, and their general elegance unroll them for many practical purposes, yet their essential roundness, uprightness, and formality afford the fine training to the penman, and prevent him from falling into an angular, slanting, or lax hand. Their very great beauty, moreover, makes them well worth practising, and even justifies their use (in a modernised form) for special MSS., for the more romantic books—such as poetry and "fairy tales"—are generally where speed in writing or reading is not essential.

With an eye trained and a hand disciplined for the practice of an Irish or English Half-Uncial, a modified type, such as is given in fig. 50, the penman may easily acquire some of the more practical later "slanted-pen" types.

"SLANTED-PEN" SMALL-LETTERS

Typical Examples:

Carlovingian ninth-century MS. — Fig. 8 (enlarged, fig. 171):

---

\(^1\) The writing in fig. 170 shows a slightly slanted pen. Make quite horizontal thins is difficult, and was probably never done, but it is worth attempting them nearly horizontal for the sake of training the hand.
English tenth-century MS.—Plate VIII. (enlarged, fig. 172):

English eleventh-century MS.—Plate IX. (enlarged, fig. 173):

Italian twelfth-century MS.—Plate X. (enlarged, fig. 174).

The use of the “slanted pen” generally produced longer, narrower, and stiffer letters. Its effects are detailed in pp. 43–47, and fig. 11, and may best be studied in the tenth-century example (fig. 172—the letter forms are described on p. 416).

In the Carolingian MS.—which does not show these effects in any marked degree—we may note the wide letter forms, the wide spacing, the long stems (thickened above by additional strokes), the slight slope of the letters, and the general effect of neatness and freedom (see fig. 171). Carolingian MSS. may be said to represent a sort of mediaeval copy-books, and their far-reaching influence on writing makes them of great interest to the modern penman, who would, moreover, find one of these hands an excellent model for a free “formal hand.”

For practical purposes the “slanted-pen” letter generally superior to the “straight-pen” letter. The “slanted-pen” letters have greater strength and legibility, due mainly to the presence of the thick horizontals—often equal in width to the verticals. Their use saves both space and time, as they are narrower, and more easily and freely written than the straight-pen forms.

The real importance to us of these early types

Note.—Single-line ruling is commonly used—the writing on, or a little above or below, the line: this allows of greater freedom than the double line (see p. 304).
Fig. 171.—Part of fig. 8, enlarged three times linear (see p. 305).
The Roman Alphabet & its Derivatives

Fig. 172. — Fig. 12, enlarged twice linear (see p. 305 & Plate VIII.). Note: top line is cut down.
Fig. 173.—Part of Plate IX. (Charter of Cnut), enlarged three times linear (see p. 416).
Fig. 174.—Part of Plate X., enlarged three times linear (see pp. 417-419).
lies, I think, in their relation to the Roman Small- 
Letter (pp. 418–19 & 429–83), and their great 
possibilities of development into modern formal 
hands approaching the "Roman" type.

ROMAN SMALL-LETTERS

Ex. : (Italian) Plates XIX., XX. (15th century); 
figs. 175, 176 (16th century): figs. 147, 148 (modern 
MS.).

The Roman Small-Letter is the universally recog-
nised type in which the majority of books and papers 
are printed. Its form has been in use for over 400 
years (without essential alteration) and as far as we 
are concerned it may be regarded as permanent.

And it is the object of the scribe or letter-maker 
gradually to attain a fine, personal, formal hand, 
assimilating to the Roman Small-Letter; a hand 
against the familiar and present form of which no 
allegations of unreadableness can be raised, and a 
hand having a beauty and character now absent or 
unfamiliar. The related Italic will be mastered for 
formal MS. work (p. 315), and the ordinary hand-
writing improved (p. 323). These three hands point 
the advance of the practical, modern scribe.

The Roman Small-Letter is essentially a pen form 
(and preferably a "slanted-pen" form; p. 305), and 
we would do well to follow its natural development 
from the Roman Capital—through Round Letters and 
Slanted-Pen forms—so that we may arrive at a truly 
developed and characteristic type, suitable for any 
formal manuscript work and full of suggestions for 
printers and letter-craftsmen generally.

A finished form, such as that in Plate XX.— 
or even that of fig. 175—would present many 
310
difficulties to the unpractised scribe, and one who so began would be apt to remain a mere copyist, more or less unconscious of the vitality and character of the letter. An earlier type of letter—such as that in Plate VIII.—enables the scribe to combine speed with accuracy, and fits him at length to deal with the letters that represent the latest and most formal development of penmanship.

And in this connection, beware of practising with a fine nib, which tends to inaccuracy and the substitution of prettiness for character. Stick to definite pen strokes, and preserve the definite shapes and the uniformity of the serifs (p. 324): if these be made clumsily, they become clumsy lumps. It may be impossible always to ascertain the exact forms—especially of terminals and finishing strokes—for the practised scribe has attained a great uniformity and some sleight of hand which cannot be deliberately copied. But—whatever the exact forms—we may be sure that in the best hands they are produced by uniform and proper pen strokes.

ITALICS

Ex.: Plate XXI., and figs. 94, 177, 178 (enlarged).

_Italics_¹ closely resemble the Roman Small-Letters, but are slightly narrowed, slightly sloped to the

---

¹ It is convenient to use the term "_Italics_" for both the cursive formal writing and the printing resembling it. _Italic type_ was first used in a "Virgil" printed by Aldus Manutius of Venice in 1500. The type was then called "Venetian" or "Aldine." It was counterfeited almost immediately (in Germany and Holland it was called "cursive"); Wynkin de Worde used it in 1524. It seems to have been originally intended for printing entire Classics, but was afterwards used to distinguish portions of the text (see also p. 373).

The Roman Alphabet & its Derivatives

Fig. 176.—(From same MS. as fig. 175, enlarged three times linear.)
The Roman right, and very freely written (commonly with "slanted pen"). The serifs generally consist of natural terminal hooks, &c.—though in "p" an finishing stroke is sometimes added. Ascending descending strokes (in "b, d, f, h, k, l, g, j, p, s, c") are commonly rather long, and often end in c or sometimes in flourishes (fig. 177).

![Simple-serif and flourished Italics](image)

**Fig. 177.**

The lines of writing are generally widely—allowing for the long stems: the bodies letters being narrow are generally rather packed, and frequently the lines of writing.
Almost continuous light but compact writing, like the ascenders and descenders and parts of the italics may be flourished freely in the spaces between the lines—sometimes filling them with ornamental pen work, which contrasts strongly with the eme plainness and regularity of the bodies.

Italic Capitals are a variety of the Roman Capitals, intly sloped (frequently less sloped than the accompanying small-letters), and sometimes much flourished (fig. 177). The types modelled on the latter are called by printers in the seventeenth century, rash Letters."

Use of Italics.—In printing they served at first to mark such portions of the text as—

Quotations, Emphasising, Words not part of the Text (e.g. Chapter headings in the Bible, &c.).

In MSS. when it is not desirable to alter the character, Red Writing (see p. 130) may be substituted for italics. Italics—either in black or red—are best with "Roman" characters.

Like the Roman Small-Letter, the Italic is a generally recognised and accepted form: this and other considerations, such as the peculiar elegance of the letters, their formal relation to modern handwriting, their compactness and economy of space in the line, and the fact that they may be written easily and with extreme regularity being indeed the most rapid of formal hands—are critical reasons for a careful study of the type, and ify the writing of certain MS. books entirely in italics.

Semi-Formal Writing

s. 179, 180, and 181 are taken from a six-century Italian MS.¹ written in a semi-cursive hand in dark brown and red-brown (probably originally nearer black and red), on leaves of fine paper.

The proportions of the Book,² together with the writing, have a very agreeable effect, and are sting as being used by a writer over 300 years. The extra width of the side margins may have allowed for annotations—some notes were n in by the scribe himself.

11\frac{1}{8} inches high, 8 inches wide.
\[
\begin{align*}
\text{Inner} & = 1\frac{1}{8} \text{ inch (approximate).} \\
\text{Top} & = 1\frac{3}{4} \text{ inch (constant).} \\
\text{Side} & = 2\frac{1}{4} \text{ inch (approximate).} \\
\text{Foot} & = 3 \text{ inch (approximate).}
\end{align*}
\]

-Line Space nearly \( \frac{5}{6} \) inch high: length (varies), average inches.

Lumm nearly 6\frac{1}{2} inches high, consisting of 22 lines of MS.

Character of the Writing.—The good shapes of letters, their great uniformity, and their easy formal arrangement, mark this MS. as the work of a skillful penman. But, while pen character of is very evident, the writing approaches the aphic (apparently a rather narrow blunt nib), and the absence of definite thicks and distinguishes it from all the formal hands to discussed: it may conveniently be termed formal.

—Book is a catalogue of early Roman inscriptions: slightly a written copy of a printed book, th a sheet of paper 11\frac{1}{2} inches by 16 inches the student reconstruct these.

Construction.—The rapidity and uniformity of his writing are largely due to an extremely easy zigzag movement of the pen, such as is natural in writing m, n, and u—the final upstroke usually running on into the next letter. Note particularly that the joined up round letters, c, d, e, g, o, q begin with nearly straight down stroke—like the first part of

mnu mnu &c.

construction of stems B.

DN N &c.

Semi-formal Writing.

FIG. 182.

to which tops are added (see fig. 182). In the case of a, the first stroke curves forward to meet the second.
In the straight-stemmed capitals B, D, E, F, H, I, L, M, N, P, R, and T, the first stroke is made rather like an \( \downarrow \) (showing the tendency to a zigzag at the foot of which is generally crossed horizontally) by a second stroke making a form resembling \( \downarrow \) on this as a base, the rest of the letter is formed (see fig. 182). This tends to preserve the uniformity of the letters: and gives a fine constructive effect as, for example, in the letter \( \text{N} \).

**General Remarks.**—The semi-formal nature of such a MS. would seem to permit of a good quill— not necessarily sharp—being used with the utmost freedom and all reasonable personal *sleight of hand* of soft tinted inks—such as browns and brown-red of an un-ruled page (*a pattern page ruled dark, being laid under the writing paper, will, by showing through keep the writing sufficiently straight*), and of a minimum of precision in the arrangement of the text. And in this freedom and informality lie the reasons for and against the use of such a hand. There is danger of its becoming more informal and degenerating because it lacks the effect of the true pen preserving form. But, on the other hand, it combines great rapidity and freedom with beauty and legibility: few printed books could compete in chart with this old "catalogue," which took the scribe but little longer to write than we might take *scribbling* it.

Many uses for such a hand will suggest themselves. Semi-formal documents which require

---

1 Practising a more formal hand as a corrective would prevent this.
neatly written out, and Books and Records of which only one or two copies are required, and in Books which are worthy to be—but never—printed, might, at a comparatively low cost, preserved in this legible and beautiful form. It suggests possibilities for an improvement in the ordinary present-day handwriting—a thing much to desired, and one of the most practical benefits the study of calligraphy. The practical scribe, any rate, will prove the advantages of being a od all-round penman.

The Roman Alphabet & its Derivatives

OF FORMAL WRITING GENERALLY

On Copying a Hand.—Our intentions being right (viz. to make our work essentially readable) and our tions being expedient (viz. to select and copy the nple forms which have remained essentially the me, leaving the complex forms which have passed t of use—see pp. 195–6), we need not vex our- ves with the question of “lawfulness.”¹
Where beautiful character is the natural product a tool, any person may at any time give such aracter to a useful form, and as at this time a properly cut and handled pen will produce letters resembling those of the early MSS., we may take models such early, simple pen-forms as have remained essentially the same,² and copy them as osely as we can while keeping them exact and mal. Finally, personal quality is essential to perfect

¹ The Law fulfills itself: that which we must not copy is that which we cannot copy.
² E.g. the letters in the tenth-century English hand—Plate II.: excepting the archaic long ʃ and round ʒ (b, fig. 183).
workmanship, but that is the natural and gradual—
sometimes scarcely visible—departure from a model,
that comes of practice and time.

*Forms of Letters: component pen-strokes.*—In a good
hand the chief component strokes—stems, bows, and
serifs—are repeated again and again (see pp. 244, 254)—this is essential to the uniform character
and the quickness of the writing. When substi-
tuting a *new* for an *old* letter a naturally used pen
will produce such common pen-strokes, giving the
desired “family likeness” to the new letter¹ (b, fig.
183).

*Proportion² of Thick Strokes.*—The broader the
thick stroke is in proportion to the height of a
letter, the more the form of the letter is controlled
and affected by the pen (c, fig. 183). For training
and practice, therefore, the wide nib is the most
useful. A narrower nib (d or e) allows of more
freedom and variety, and there is a great charm in
slender lettering—this the trained scribe may essay
(see Plate XX., and p. 482).

*Proportion² of Stem Height.*—The character of a
writing depends very much on whether the stems
are *short*, *medium*, or *long*. The stems of b and p
may be as short as half the height of the bodies
(f, fig. 183); a *medium* stem for ordinary use might
be two-thirds of, or equal to, the height of the
body (g). Stems may be drawn out to almost any

¹ The propriety of the actual form of the new letter will
largely depend on the scribe’s knowledge of the development of
that particular letter and its component parts: comf. the in-
teresting development of g, sketched in figs. 3 & 183 (but
note correction of example 173 in Addenda, p. 26).
² The proportions of the *thick strokes*, *stem heights*, &c., in a
given hand need not be exactly followed, but it should be
recognised that any alteration in these will *inevitably alter the
forms and the character of the letters* (fig. 183, and pp. 84 & 26).

in MS. books—is really a more important unit than

\footnotesize{\textsuperscript{1} In English so many ascending and descending letters are
used, that it might be the best and most natural treatment of
these to make them a marked feature of the writing (see also
“Fine Writing,” pp. 261-63). Note, in this connection, that our
\textit{a b c} has been developed as a Latin alphabet, and that the
evenness of Latin MS. is largely due to the infrequency of tailed
letters.}
the page; and the whole question of the arrangement of Lettering hinges on the right treatment of the lines. One is particularly struck by the distinctness of the lines of writing in the old MSS., due mainly to—

(a) The binding together of the letters in the line—commonly by strong serifs or heavy "shoulders" and "feet" (see figs. 11, 184, and p. 414).
(b) Packing the letters well together (see pp. 77, 262).
(c) Spacing the lines sufficiently apart (see pp. 262–265).

It is a good rule (especially when practising) to space the lines fairly widely. Really fine writing shows generally to greater advantage if not too much crowded, and there is more danger of making reading hard by crowding the lines, then by crowding the words (see fig. 156).

Whatever mode of treatment be followed, each line should be written with as much freedom as possible, the simplest straightforward writing being preferable to that which is over-arranged.

DECORATIVE CONTRASTS

The decorative treatment of lettering generally involves contrasts of size, weight, colour, or form—that is, of large and small, heavy and light, variously coloured, or variously shaped letters. As a general rule, marked contrasts are best; a slight contrast may fail of its effect and yet be sufficiently noticeable to give an unpleasant appearance of irregularity.

Contrasts of Colour (see pp. 144, 180).—Note that, while it is convenient to distinguish "colour"—as red, blue, green, &c.—weight strictly involves
The Roman Alphabet & its Derivatives

colour: built-up or heavy letters in black show extra black beside lighter writing, while the latter appears grey in comparison (see figs. 197, 186); in red writing the heavy letters appear red, the lighter letters, pink (see fig. 90).

Contrast of Size.—The simplest decorative contrast is that of LARGE\textsuperscript{1} letters with SMALLER letters (fig. 185); the strokes being of equal, or nearly equal, weight, there is an harmonious evenness of tone throughout. Where the large letters are very much larger, their parts are made somewhat heavier to keep their apparent “weight” approximately equal (see p. 486). This is one of the most effective treatments for inscriptions generally (see p. 299, and Plates V. and XXIV.).

Contrasts of “weight” and size.—In simple writing these are obtained by using two sizes of pen—the small, light letters being used for the bulk of the

\end{itemize}

1 Where there is only a slight difference in size, the effect is improved by using a different form or colour (see pp. 130, 345).

328
xt, the larger heavier letters being used for occa-
onal words or lines (or *vice versa*). This is a very
efective simple treatment for MSS. (fig. 186).

The occasional letters may be more decoratively
ted (see *Responses and Rubrics*, p. 345) by intro-
cing the further contrasts of *colour* (p. 144) or
m (p. 336).
The Roman Alphabet. & its Derivatives

Contrasts of form, "weight," and size.—The contrasts are generally obtained by the use of large built-up capitals, together with a simple-written (ordinarily printed) text (fig. 187).

Contrast of form, weight & size, generally, colour.

Fig. 187.

A marked contrast usually being desirable, built-up capitals (especially if black) are safest if distinct from the rest of the text (see fig. 197); they are scattered among the other letters they are apt to show like blots and give an appearance of irregularity to the whole. As a rule, the effect is improved by the use of red or another colour (figs. 91, 93).

Contrast of form—for decorative purposes—is usually combined with contrast of weight ("Gothic," heavier, p. 336) or size (e.g. Capital, larger, p. 371).

Ornamental Letters

(See Chaps. VII., VIII., X., XII., & pp. 34, 251, 330

To give ornament its true value we must distinguish between ordinary occasions when simplicity and directness are required, and special occasions when elaboration is desirable or necessary.

The best way to make ornamental letters is to develop them from the simpler forms. Any p
The Roman Alphabet & its Derivatives

e may be decoratively treated for special purposes some part or parts of the letters usually being ornally “exaggerated” (p. 252). Free stems, ranches,” tails, &c., may be drawn out, and terminals or serifs may be decorated or flourished (fig. 5).

Built-Up Forms.—Even greater license (see fig. 1) is allowed in Built-Up Letters—as they are under the control of the tool (p. 292)—and their natural decorative development tends to provide a subordinate simple line decoration beside or in their thicker parts (fig. 189 & p. 26). In MSS. typical built-up, ornamental form is the “Versal” (Chap. VII.), which developed—or degenerated into the “Lombardic” (fig. 1). Here again it is preferable to keep to the simpler form and to develop natural decorative treatment of it for ourselves.

'Black Letter” or “Gothic,” still in use as an amental letter (fig. 190), is descended from the tenth-century writing of Northern Europe (Plate VII.). A better model may be found in the earlier more lively forms of twelfth- and thirteenth century writing (fig. 191).

Rightly made, and used, it is one of the most picturesque forms of lettering—and therefore of ament—and besides its ornamental value, there still in the popular fancy a halo of romance about 'ack letter,” which may fairly be taken into bunt. Its comparative illegibility, however,—mainly to the substitution of straight for curved kes—debars it from ordinary use. Though its

Compare monotone and monotone. For general purposes, efore, and particularly for forming a good hand, the earlier ists are to be preferred (or the late Italian): even twelfthury “Gothic” writing is hardly readable enough foractical” purposes.

331
The Roman Alphabet & its Derivatives

The serifs are usually more strongly marked to show the termination of the strokes of the top line of writing may have ascenders flourished into top margins of the writing line. In the foot margin the descenders of many letters flourished away from the top line. It may have been at a later period that this practice terminated completely, and the base line and top line of the writing line were made parallel to each other. The Romans also introduced the practice of fluting the top of the letter, and in the foot margin, the line of the letter was sometimes carried up to the top of the letter, as in the case of the letter 'N'.

DIVERS USES OF LETTERING

The following list of some of the uses of hand-lettering, though necessarily very brief, will perhaps suggest possibilities both to the student and the craftsman:

S. BOOKS, &c.: (see pp. 98, 341, & Author's Preface).

Fine Literature:

1. Preferably "the best."
2. That which is worthy of calligraphy.
3. That which is the "favourite" of the owner of the book.

Poetry is differently treated from prose (see pp. 95, 263, 371, 138), and should have extra wide side margins when possible (p. 483).
<table>

Decoration for hangings, (p. 336): Marking clothes,
All the arts employ lettering directly or indirectly, fine decoration or for simple service. The following list of ancient uses is interesting:

"I. TITULI"

Dedicatory and Votive Inscriptions (Tituli Sacri).
Sepulchral Inscriptions (Tituli Sepulchrales).
Honorary Inscriptions (Tituli Honorarii).
Inscriptions on Public Works (Tituli Operum Publicorum).
Inscriptions on Movable Objects (Instrumentum).

II. INSTRUMENTA"

Laws (Leges et Plebi Scita).
Decrees of the Senate (Senatus Consulta).
Imperial Documents (Instrumenta Imperatorum).
Decrees of Magistrates (Decreta Magistratuum).
Private Documents (Acta Privata).
Wall Inscriptions (Inscriptiones Parietariae).
Consular Diptychs (Diptycha Consularia)."

MS. BOOKS, &C.

Books in the making—as compared with ordinary inscriptions—are capable of great compression or expansion, and may be said to have a quality of festivity. Nearly all other ordinary inscriptions are inscriptions (p. 350), requiring a given number of words to be set out in a given space. But in books, while it is convenient that the treatment of the text should conform generally to a chosen size of page (p. 103), the contents of the page may vary according to the letter-form and the spacing (pp. 227, 262), and the number of the pages is not definitely limited, so that another page, or a number..."
of additional pages, may always be taken to complete the text.

The size of page, margin, and writing having been settled (see Chap. VI.)—and the pages ruled—the penman writes out the text with the utmost freedom, not stopping to make fine calculations, by leaving such spaces and lines, for Initials, Headings, &c., as his fancy and common-sense dictate, and letting the text—or its divisions—smoothly flow from page to page till a natural termination is reached. And if the terminal page has only one or two lines on it, it is not necessary to attempt a balance with the previous page—the book or chapter ends just there, for the good reason that there is more of it.

Colophons, Tail-pieces, &c. (see p. 142), make a pleasant finish, and may complete the page or not as convenient.

Planning: Sections and Pages.—Calculations of the amount of text, of the number of sections or pages required, and so on, are useful, and planning the pages may be convenient—for example, one or more of the verses of a poem, or a given number of words may be allotted to the page—provided always that the scribe preserves his freedom, and treats each column on its merits. If he think it most suitable to devote a complete page to each paragraph, he may do so, despite of its resulting in the pages all being of different lengths.

The one general limitation which it is proper

---

1 If there is sufficient room left on the terminal page for a clearly marked beginning (such as a decorative initial), the chapter may begin there, and so fill the page—but generally there is no objection to leaving blank what the text has failed to fill.
Observe is that of the Writing-line—its length and pacing—and to this may be added the desirability of beginning the text of every page on the first or ead line. For most of us it is not practically possible to do without the aid of the writing-lines—which really lead, through uniformity, to greater freedom—though a book written without them might be as beautiful as any ruled manuscript.

Marginal Lines.—These, the terminals of the writing-lines, are frequently made double, with about 1\textfrac{1}{4} inch between (see Plates XX. and XV.). On the left this space is utilised for marginal capitals, or is left blank; on the right the first line acts as a warning mark and the normal termination of the text, the second as a barrier beyond which the writing would not go. The double lines, in being more obvious than single lines, are also more effective in straightening” the page (p. 109): presumably for this reason the two upper and two lower writing-lines were often ruled from edge to edge of the page (see Plate XI.).

Ruling.—Marginal and writing-lines, once ruled, are to be left intact, and may be regarded as actual component parts of the finished pages. They are best made with a hard blunt point (p. 108)—the arrows so made give an interesting character, almost a “texture,” to the smooth surface of the page. But they may be ruled with a fine lead pencil, or with a fine pen and faint black or coloured inks.

1 The line need not always be filled by the writing (p. 425).
2 It would not be necessary for the first page of a chapter to have the ordinary dropped head and blank upper space if an initial or decorative heading were used to mark it.
3 Some of the books engraved by William Blake suggest possibilities of such un-conventional treatment, both of writing and illumination” (see also p. 21).
Special Subjects

Inked or coloured lines, however, are not general written upon (see footnote, p. 305), but between (see Plates XIII., XVII., XX., &c.).

Correcting Mistakes.—A neatly made rather small letter above and a caret (\^) below (as in ordinary writing) may be used for an omission (fig. 192). Superfluous letter may be neatly struck out. Erasures are usually unsatisfactory, and a simple, unostentatious correction, besides disarming criticism, is in accordance with the proper freedom of the craft (p. 174). In an important Manuscript the page better re-written.

Annotations, &c., preferably in smaller colour writing, are very decorative in the broader margin (pp. 144, 315).

Special Books.—A MS. book is necessarily unique and some special or personal interest—either of the craftsman (see p. 142) or his "client"—inevitably attaches to it. This may affect its size and form the treatment of the text, and the decoration and construction generally (see p. 100). Every legitimate opportunity of adding to its individual character should be taken by the scribe and illuminator.
Fig. 175 and Plate XX. are both taken from private prayer books or psalters; in each the name of the owner (e.g. "Euanzelista famulo tuo," Plate X.) is frequently inserted. Plates XV. and XXII. are also taken from specially commissioned MSS., and many evidences of their ownership, such as portraits or coats-of-arms, form part of the decoration of such books.

Church Services, &c.—(For a special church or person.) Church uses are so varied, that it is most important to ascertain the custom, use, or taste of the persons concerned—especially as to the order and the introduction or omission of, certain words, paragraphs, or parts, the colours used in the text, the notation of the music—and the manner which the book will be used.

A service book for the use of a priest gives prominence to the parts in which he is concerned; the responses may be smaller, and different in size or colour. The rubrics—in red (see pp. 140, 141)—are kept quite distinct, and may form a very corative feature. For a private person the other parts—such as are said by the congregation—might specially marked. In either case a certain amount of planning—e.g. completing prayers, &c., in an orderly manner, to avoid turning over—may be justified by convenience to the reader. Should very careful planning ever be required, a pattern-book may be made, having the contents of each page roughly indicated in it.

Wedding Service Books, &c.—The interest and
Special Subjects—containing the proper names and dates, and of the special psalms, hymns, prayers, homilies, & which will be used. Dated pages may be provided at the end of the book for the signatures of “friends and neighbours” of the principals.

BINDING MSS.

MSS. should be bound without delay in order to complete and protect them.

To bind books in stiff boards, in leather, requires considerable practice and skill, but a very effective limp vellum cover can be made by the scribe himself, who, in binding his own books, will learn to think of the binding as a part of the book, and to allow it in the writing and planning (see p. 106).

The following note on covering books in limp vellum is specially contributed by Mr. Douglas Cockerell:

“How to cover a book in a limp vellum cover without using special appliances.

“Cut four strips of stiff vellum 3\frac{3}{8} inch wide and about four inches long. On these slips you will sew the sections of your book.

“Add to your book a plain section at either end for a vellum book, paper for a paper book. Knock up the backs of the sections squarely, keeping the heads level, and across the back mark with a flat pencil guided by a square, lines to show the position of the slips. The positions of the four slips should leave the space between the slips the same as that between

---

1 Figs. 195 and 196 are from Mr. Cockerell’s “Bookbinding and the Care of Books,” in this Series.
2 These form the fly-leaves (p. 111).
p slip and the head of the book; the ace between the bottom slip and the 1 should be a little longer than the aces between the slips. At about \( \frac{1}{2} \) inch from either end make an additional ae across the back for the 'kettle' or tch stitch. These lines will show dots on the back of single sections. Each individual section should now ave at the back a dot at either end r the kettle stitches, and four pairs o dots \( \frac{3}{4} \) inch apart to show the position the slips, ten dots in all.

"To sew the book, fold the vellum ps about \( \frac{1}{2} \) inch from one end and nd to a right angle. Place your front d-paper outside downwards, with the ck even with the edge of a table or ard, and place your folded slips with eir shorter ends under it. Then insert our needle from the outside, at the ad 'kettle stitch' mark, into the centre the section and bring it out at the st band mark; put the slip in position d reinsert your needle at the mark on e other side of the slip, and so on to e end of the section, coming out at the il kettle stitch. This should leave our section with a thread,\(^1\) passing ternately along the centre fold inside d across the slips outside, with a se end hanging from the kettle stitch ark where you began, and a thread ith the needle hanging from the other ttle stitch mark (fig 193).

---

\(^1\) Thread should be unbleached. Silk of e best quality is better than thread.
“Lay on your next section and sew it in the same way but in the reverse direction, tying up with the first loop end when you come to it. Sew the whole book in the same way, tying on a new needleful of thread as each section is exhausted, making practically a continuous thread go backwards and forwards inside the sections and across from end to end of the book. Each succeeding kettle stitch should be caught up by a loop (fig. 194), and it is well to catch together the loose threads crossing the slips.

“When the book is sewn, the back may be covered with thin glue and lined with a piece of leather, but as this is a little difficult to manage neatly, and as the book holds together without it, for a temporary binding sections may be left without glue.

“For the cover cut a piece of covering vellum\(^1\) (vellum with a surface) large enough to cover the book and leave a margin of 1½ inches all round. Mark this with a folder on the underside, as shown at A, fig. 195. Spaces (1) and (2) are the size of the sides of the book with the surrounding 'squares,' \(^2\) space (3) is the width of the back, and space (4) the width for the overlaps on foredge.\(^3\) Cut the corners as shown at (5), and fold the edges over as at B, and then fold over the overlaps.

---

1 Forrel may be used as a cheap substitute for vellum.
2 "Squares" = "the portion of the boards projecting beyond the edges of the book."
3 "Foredge" = "(fore edge) the front edge of the leaves."
To make all folds sharp and true.

"To avoid mistakes it is well to make a cover of stiff
Special Subjects

paper first, and then, when that fits exactly, to mark the vellum from it.

"On the inside of the vellum cover, mark faint lines about \( \frac{3}{4} \) inch from, and parallel to, the creases of the book, and further lines about \( \frac{1}{2} \) inch from these. Place your book in the cover and mark the places where the lines cross these lines. Make slits in the cover there, and put the slips through them (fig. 196), first putting a piece of loose, toned paper inside the cover to prevent any marks on the book from showing through the vellum. Tie in lace pieces of silk ribbon of good quality\(^1\) through the cover and end-papers, leaving the ends long enough to tie."

**BROADSIDES, WALL INSCRIPTIONS, &c.**

_Set Inscriptions._—Ordinary inscriptions generally consist of a given number of words to be set out

---

\(^1\) A good, rather dark green ribbon looks well—such as is known as "Church lace," used for the "tyres" in some of the Kelmscott books. Very good ribbons may be obtained from a bookbinder, at 6d. to 1s. 6d. a yard.
given space. Careful planning may sometimes be required to fit in the words suitably, or to adapt the lettering to the space. But setting-out (p. 258) becomes much simpler after a little practice, and the good craftsman avoids over-planning.

**The Place of the Inscription.**—The actual space for a wall inscription is commonly suggested by an architectural feature—a stone, a panel, or a niche of the wall; but in choosing a suitable space for a given inscription, or suitable lettering for a given space, we must take into account—

1. **The office of the inscription.**
2. **How it is to be read**—
   (a) "At a glance," or
   (b) by close inspection.
3. **The distance from the reader.**
4. **The lighting of the space.**
5. **The character of the surroundings.**
6. **Any special features.**

**The Size of the Letters.**—The all-important question of readableness may be settled thus: the inscription having been planned suitably to fill the space, one or two words are written or painted (the exact size) on paper—smoked or otherwise coloured if necessary to resemble the background. This is stuck upon the chosen part of the wall, and then viewed from the ordinary position of a reader. When the inscription is high up, the thin parts—especially the horizontals of the letters—must be made extra thick to be seen properly from below.

**Margins.**—Wide margins are only required for comparatively small lettering which demands the close
attention of the reader, and generally a set inscription looks best if the lettering be comparatively large—covering most of the given surface, and leaving comparatively narrow margins. The frame or moulding, or the natural edge or environment of the circumscribed space, is very often sufficient “margin” (see Plate XXIV.).

The margins vary, however, according to circumstances; especially the foot margin, which may be very narrow if all the space is required for the lettering (see fig. 211), or very large there is plenty of space (see fig. 210). As in special pages or terminal pages of books, in single sheets, panels, &c., the “foot margin” may show—as it really is—as the space which a not require to be filled, and was therefore “left over.”

Number of Different Types.—While in a book many pages considerable diversity is allowed, it essential to the strength and dignity of a single sheet or set inscription to limit the number types employed in it. Three or four ordinary types will generally give sufficient variety, if it be necessary—as in notices and placards that Important Words be put in special types catch the eye, let two—or at most three—special types suffice, and let the remainder of the type be as quiet and reserved as possible. “Display Types” commonly defeat their object by being overdone. A simple contrast is the most effective (fig. 197).

---

1 E.g. all ordinary written and printed matter intended to read at a short distance (see pp. 103–106), and generally held in hand.
2 As much as two-thirds, or more, of the whole space.
CAPITALS

in the head-line, large and spaced wide, are contrasted with a mass of smaller lettering below (see p. 330). Note.—Generally a finer—though less striking—effect is obtained by keeping large capitals rather slender—contrasting size rather than weight (p. 328).

FIG. 197.

ILLUMINATED ADDRESSES, &c.

Forms of Addresses, &c.—The writer should be prepared to advise his “clients” on the form which the address may take, on special features in its writing and illuminating, and on its general treatment.

Ordinarily an Illuminated Address is prepared either as a Framed Parchment (p. 356), a Parchment scroll, or sheet (p. 356), or a small bound MS. (i.e. a book form: p. 357).¹

The wording commonly consists of three parts: the Heading (usually the name of the addressee), the Text (usually divided into paragraphs), the Signatures (or a list of names) of the subscribers.

An address is commonly in the 1st or 3rd person, and in case of any confusion of these, any slip of the pen, or other oversight in the draft, the penman

¹ The addressee’s taste and convenience ought to be considered: e.g. to one the framed inscription might be an embarrassment, while by another it might be preferred.
should, if possible, call attention to it before the
document is put into permanent form.

A very convenient and agreeable style of "a-
dress" is a formal letter, beginning "Dear Mr
A—B—," and ending in the ordinary way. This
is a form which may be drawn up more simply, and
which reads more naturally, than the ordinary 1st
or 3rd personal statement.

An "address" is sometimes in the form of
resolution passed by a public or private body or
committee. For municipal or other important cor-
porations, such an extract from their minutes, near
and "clerkly" written out on parchment, and duly
attested by the signatures of their "head" and the
secretary, and without ornament save their seal
on a dependent ribbon—or their coat-of-arms, or
badge, would not only be the most natural, but
possibly the most dignified and effective shape \which might be given to the formal presentation of the
compliments.

An "address" accompanying a present is fre-
quently little more than a list of names with a brief
complimentary or explanatory statement. If pos-
sible such an inscription should be written or
engraved on the article itself, or be specially design-
to accompany it. In some cases this is very simple:
when a volume, or set of volumes, is given, the
inscription may be written in the first volume—or
on a parchment which may be inserted—or it may
be prepared in book form, in a binding to match.
A silver statuette or "ornament" may have a line
drawer provided to hold a narrow scroll of names.
A portrait may have an inscription on the frame—or
even in a corner of the picture—or be accom-
panied by a simple, framed parchment.
Signatures.—A neatly written out list of subscribers—especially when their number is large—very convenient: it does not require individual personal appointments, nor involve risks of damage the address. The actual signatures of subscribers, never, are of greater interest and sentimental value, and on such grounds are preferable to a mere list of names.

To avoid risks (or with a view to incorporating signatures in the decorative scheme) the decoration, gilding, &c., may sometimes be deferred until after the signing of the address.

When the exact number and the names of the subscribers are known beforehand, lines may be divided for their signatures, marked with letters alphabetical order (the proper number of lines for each). This method solves any difficulty in ascertaining precedence in signing.

Note.—Ordinary signatures require about ½ inch 3 inches space each. If there are many they may conveniently arranged in two or more columns, according to the space available.

Directions for Signing:

1. Edges of parchment not to project beyond desk or table, lest they be creased.
2. Paper to be provided to cover the address, with flaps to raise when signing.
3. When lines for signatures are grooved (p. 108), signatories to face the light (this makes the lines more evident).
4. Ink of one colour to be used if possible.
5. Clean, ordinary pens to be provided, and scraps of the vellum or parchment for trying them on.

be given (with scraps) to the person in charge of the address.
**Framed Parchments.**—The written parchment may, with care, be pasted upon a stout card—a piece of plain parchment on the back of the card will check warping. Or, the written parchment may be damped, by laying it for a few seconds on damp blotting paper, and then be stuck to a board carefully glued round the edges: in either case press under heavy weight for twelve hours. Or—extra margin being allowed—the edges of the parchment may be cut into tags, folded over an ordinary canvas stretched and well tacked at the back with small brads. The wedges are carefully adjusted till the parchment is flat.

A parchment mounted first is simplest, but it affords a less natural surface, and is not so easily managed by the penman as the plain, flexible parchment.

**Frames** should be gold, black, or white; the plain, and generally without mounts. The parchment, however, must be so framed (e.g. with a concealed slip of wood behind the glass) that there is no danger of any part of it coming into contact with the glass (as that, being damp, would lead to cockling).

**Parchment Scroll.**—The foot edge of the parchment may be folded over twice,¹ a strong, silk rib (see footnote, p. 350) is laced along through slits in the folded part (a, fig. 198), so that the two come out again at the centre—where they may be knotted together—and are ready to tie round the scroll when it is rolled up (b). A rather narrow “upright” parchment is most convenient (c). “Oblong” parchment may be very effectively arranged.

---

¹ The original intention of this fold, in deeds, was to provide for the attachment of the seal, and, perhaps, to prevent addition being made. If the folded part be fairly wide (say \(\frac{1}{2}\) to 1 inch, little or no foot margin need be allowed.
If the lines are kept strongly spaced well apart.

If a casket or case is not provided, a neat japanned case may be obtained for a few shillings.

A small Bound MS. is certainly the most easily handled form in which an address may be prepared - its convenience to the penman, the signatories, the reader, and the addressee, is strongly in its favour. A lengthy address, or a very large number of names, may be contained in a comparatively small book.

FIG. 198.

long lines of writing (d) if the lines are kept strongly spaced well apart.
Special Subjects

Method of Planning out Addresses, &c.—If in book form, the address is treated much as an ordinary book (see Chap. VI., and Binding, p. 346). The framed or scroll address is planned similarly to a single sheet (p. 90). The following notes of a working method were made during the planning out of an address:

(1) Decide approximately the general form, shape, and decorative treatment of address.

(2) Count words in TEXT (leaving out HEADINGS and SIGNATURES) = 130
   Count paragraphs = 3
   (Decide whether first or last paragraph is to be in a different form or colour.)
   Decide approximate width = 12 inches
   Decide approximate side margins (2½ inches each) = 5 inches
   Hence length of writing-line = 7 inches
   Allow ⅛ inch lines, and approximately eight words to the line.

(3) 130 words TEXT, approx. = 16 lines = 8 inches
   Allow extra (on account paragraphs) = 1 line = ½ inch
   (Roughly sketch out HEADING on lines each ½ inch by 7 inches.)
   Allow for HEADING = 6 lines = 3 inches
   Allow for two SIGNATURES, &c. = 3 lines = 1⅛ inches

   Total depth of Writing, &c. = 26 lines = 13 inches
   Allow for Top margin = 2 inches
   Allow for Foot margin = 3 inches

   (Note.—This was a "scroll," and the foot margin was folded up to within an inch of the SIGNATURES. A plain sheet would have required about 4 inches foot margin.)

Length of Parchment = 18 inches
(4) Cut a paper pattern, 12 inches by 18 inches. Rule (in pencil) Side margins (23 inches and 21 inches), and Top margin (2 inches), and 26 (1 inch) lines. On this write out the address in ordinary handwriting, using ordinary black and red (or coloured) inks: make approximately eight words to the line, and write as fast as possible; this helps to keep the spacing uniform.

This written pattern should not take more than twenty minutes for its entire preparation: it is intended to be used as a check on the previous calculation (not as an exact plan), and as a copy, it being easier to copy from your own, than from another's, handwriting.

If the original draft is typewritten, it is hardly necessary to make such a pattern.

(5) Check this copy very carefully with the original to see that the words, &c., are correct.

(6) Cut, rule, and pounce the parchment (pp. 343, 174).

(7) On some scraps of parchment, ruled with a few similar lines, and similarly pounced, try one or two lines of writing, both in vermilion and black, to see that all goes well.

This enables you to get the pens and inks into working order, and will very likely save the carefully prepared parchment from being spoilt.

(8) Write out the address, leaving suitable gaps for gold or special letters.

(9) Put in special letters, decorative capitals, and any other decoration.

(10) Check the finished address very carefully with the original draft (see (5) above) and look it over for mistakes, dotting i's, and putting in commas, &c., if left out. It is important that such a formal document should be accurate.

**General Remarks.**—The above simple mode of planning out can be further simplified in custom and practice. By the penman keeping to regular hapes, proportions,¹ and modes of treatment for regular

¹ E.g. to keep to ½ inch writing line spaces (except for extra small addresses, or small books). This being approximately the right space for ordinary SIGNATURES, results in further simplification of ruling and arrangement.
Special occasions, the addresses, &c., will practically "plant themselves" (p. 101), and better workmanship is the natural result.

Generally the simpler the form and the treatment of an Illuminated Address, the better the effect. The most effective decoration is the plain coloured or gold capital, and the finest ornament is a coat of-arms (see "Heraldry," below; and for general

Diagram shewing the arrangement of the charges in the earliest form of the English Coat of Arms: Ed. III.

Fig. 199.
imple Illumination, see Chapters VII. to XIII.). symbolical mark, such as a crest, badge, mono-
m, cypher, or other device (p. 362), boldly and
oratively treated, may be used in place of a coat-
arms.
There is too much “Illumination” in the con-
tional “Address,” which looks like a “piece of
oration” with a little writing. A really reasonable
effective Illuminated Address is a piece of writing
tably decorated.

Heraldry.—A reliable handbook must be con-
ted, for accurate “blazoning” is essential. Early
amples should be studied (see p. 387). The dia-
am, fig. 199, is given as an example of how a charge
is evenly arranged on the shield (see balanced back-
ground, p. 419). Another example—showing a
pered chequer—is given on p. 336.
Shields in Illuminated borders may be coloured
ore the border, lest the brilliant mass of colour
the shield clash with the border. The shield, if
ged, may with advantage set the tone of the whole
our scheme.

MONOGRAMS & DEVICES

A Monogram consists of two or more letters
ined in one form, as the diphthong AE, and
amperzand for ET: its legibility may
helped by compound colouring. A Cypher con-
ts of linked or interlaced letters, as O O, and

1 In the common form & , the letters E O (see Plate
) are now barely traceable.

361
Special Subjects may be repeated and reversed if desired (see 200).

Device used by Charles the Great: KAROLVS.

C. repeated and reversed.

The letters may be written on a piece of paper, which is folded, so that the letters reverse symmetrically, while the ink is still wet.

FIG. 200.

Monograms and cyphers may be very decoratively employed as ornaments, and may be used mark a man's goods, or as a signature on his work, something easily recognised—either very legible characteristic—is therefore desirable. The modes may be combined, and there is no limit
The effective devices and ornaments which may be composed of letters. Simple and straightforward devices, however, are generally preferable to very mate or intricate designs.

Chronograms.—A chronogram consists of a word or words in which the numerical letters indicate a date. The following is from a very fine memorial inscription at Rye (see fig. 207):

\[\text{Ioannes Three Le MeDIo Læte ætatIs fLore obIIt.}\]

Expresses the date \(1 + L + M + D + I + L + I + L + I\) (or \(1 + 50 + 1000 + 500 + 1 + 50 + 1 + 50 + 1\)) = 1655. As every letter having a numerical value (\(i.e.\) C, D, I, (J), L, M, (U), V, W), (X) may be counted, a proper chronogram is not easily composed.

The letter-craftsman will discover many ways of playing” with letters, and of expressing—or concealing—names and numbers in other words, and he may take every liberty he chooses in his private pleasure, provided it does not clash with public convenience.

**Title Pages**

If large capitals be used, the *Name of the Book, the Author, &c.,* above; the *Name of the Publisher, the Date, &c.,* below,\(^1\) may together fill the page. Ordinary capitals (as used in the text) leave a space in the centre (see Title Page of this book): often pleasantly filled by a small woodcut—a symbolical device, monogram, or printer’s mark.

Generally, the fewer and simpler the types, the

---

\(^1\) Other particulars may be put in the colophon (p. 142).
Special better: though contrasts of size, form, or colour (see p. 327)—such as printing one or two words in large CAPITALS, or in Black Letter (p. 331), or part in red—may sometimes be used with good effect. When the types are rather varied, single or double framing lines (called “rules”) placed round the page have the effect of binding the whole together. The page may also be divided into parts by transverse “rules”—these further solidify it. Black rules are preferable to red (p. 144): if they are double, the outer line may be thicker than the inner.¹

Relation of Title Pages, & c., to the Text.—Generally the practical part of the book is to be considered and settled before the ornamental and the decorated Title page conforms to the treatment of the text pages, and should be clearly related to them by the character of its letters or its ornaments. The margins (especially the top margin) should be approximately the same as those of the text pages, though framing borders may occupy part of, or nearly all, the marginal space. Without doubt the artless ordinarily printed title page is preferable to those specially designed “title pages” that have little or no relation to the rest of the book.

Wood Engraving (see pp. 365, 371).—Of all the “processes,” wood engraving agrees best with printing. The splendid effect of Title and Initial page engraved in wood may be seen in the books of the Kelmscott Press. In early printing, woodcut ornaments or borders were commonly used to decorate...

¹ The use of “rules,” though quite legitimate, will be found misleading if it be depended on to “doctor” and “pull together” any weak arrangement of lettering.
he printed title page. An example of this combined method—of which unfortunately the greater part of the borders have to be left out—is shown in fig. 01 (from a 16th century book).\footnote{More, Sir Thomas: "Utopia, et Mori et Erasmi Epigrammata": 4to, Froben, Basle, 1518. Woodcut borders and Title pages by Holbein. (The reproduction is from the title page to the Epigrams.) \textit{Note}.—The exceptionally fine type of capitals (see p. 373) here shown is used throughout the book for headings, &c.}

Initial Pages and Openings.—The claim of these decorative treatment should be considered (p. 28). We generally look at the outside of a book or the title—which should be clearly stamped on the cover. But inside the book we look rather for its actual beginning than for its name, and, while something in the nature of the "sub-title" might be used, it would be quite reasonable to revive the ancient fashion—especially in the case of MS. Books—of making the actual beginning the most decorative part of the book. Or a very fine effect may be obtained by the decoration of the entire initial opening—the title on the verso (left page), the beginning of the first chapter on the recto (right page).

\section*{LETTERING FOR REPRODUCTION}

Where it is possible, it is generally best to make use of ordinary typography. A good fount of type and a natural \textit{setting-up} or arrangement of it, are more effective than many special designs (see pp. 364, 267).

\textit{Wood and Metal Engraving}.—If special forms or arrangements of letters are required, for which types lacking or unsuited, they are best cut in wood or
EPIGRAMMATA CLA RISSIMI DI SERTISSIMI QVE VIRI THOMAE MORI BRITANNI, PLERAQVE E GRAE CIS VERSA.

Fig. 201 (see footnote, p. 365).
al. The engraver leaves the mark of his tool hand upon, and so gives character to, such ering; while, if he has some knowledge of letters, may give fresh beauty to their forms.

The Zincotype Process reproduces, either in fac¬le or on a reduced scale, the “design” made the craftsman in “black and white.” This it s more or less exactly according to the pains en by the zincographer, the quality of the paper oloyed, &c. The literalness and facility of this ess, however, seem to have had a prejudicial ct on the work of the designer. Unless he con¬ntiously determines that his design shall stand hout “touching-up,” the knowledge that he may out or trim a faulty line with white, that he fill out or finish a deficient stroke with black, he may work large and zincograph small, is to result in carelessness combined with over¬shing—or a sort of perfection without character.

If zincography be used, a strong, rather type-like r, or a built-up letter—arranged to give a general ct of richness of mass, would appear more natural in the doubtful “reproduction” of delicate writing ine pen-lettering.¹

Etching.—Calligraphy might be reproduced with y fine effect, retaining its natural delicacy and a plane surface, if a process of etching writing asimile were possible.

PRINTING
The general question of fine printing and its tion to calligraphy can only be briefly referred

Doubtful, because, unless unusua. care be taken, its delicate ity may be lost in the process, and also because of the -like impress of the block on the paper.
Special Subjects to here. A proper study of the art of typograph
necessitates practice with a printing press, and prob-
ably the help of a trained assistant.

To would-be printers, printers, and all interested
in typography, the easily acquired art of writing
may be commended as a practical introduction to
a better knowledge of letter forms and their deco-
tive possibilities.

In this connection I have quoted in the prefac
(p. 13) some remarks on Calligraphy by MCobden-Sanderson, who, again, referring to typog-
raphy, says—¹

"The passage from the Written Book to the Print-
Book was sudden and complete. Nor is it wonderful th
the earliest productions of the printing press are the mo
beautiful, and that the history of its subsequent career
but the history of its decadence. The Printer carried
into Type the tradition of the Calligrapher and of the
Calligrapher at his best. As this tradition died out at
the distance, the craft of the Printer declined. It is a
function of the Calligrapher to revive and restore the
craft of the Printer to its original purity of intention a
accomplishment. The Printer must at the same time
a Calligrapher, or in touch with him, and there must
in association with the Printing Press a Scriptorium where
beautiful writing may be practised and the art of letter-
designing kept alive. And there is this further eviden
of the dependence of printing upon writing: the gr
revival in printing which is taking place under our o
eyes, is the work of a Printer who before he was a Prin
t was a Calligrapher and an Illuminator, WILLIA
MORRIS.

"The whole duty of Typography, as of Calligraphy
to communicate to the imagination, without loss by

¹ "Ecce Mundus (The Book Beautiful)," 1902.

368
way, the thought or image intended to be communicated by the Author. And the whole duty of beautiful typography is not to substitute for the beauty or interest of the thought and intended to be conveyed by the symbol, beauty or interest of its own, but, on the one hand, to in access for that communication by the clearness and beauty of the vehicle, and on the other hand, to take advantage of every pause or stage in that communication to interpose some characteristic and restful beauty in its own art.”

*Early Printing* was in some points inferior in technical excellence to the best modern typography. But the best early printers used finer founts of type and better proportions in the arrangement and spacing of their printed pages; and it is now generally agreed that early printed books are the most beautiful. It would repay a modern printer to endeavour to find out the real grounds for this opinion, the underlying principles of the early work, and, where possible, to put them into practice.

*Freedom.*—The treatment or “planning” of early printing—and generally of all pieces of lettering which are most pleasing—is strongly marked by freedom. This freedom of former times is frequently referred to now as “spontaneity”—sometimes it would seem to be implied that there was a lawless responsibility in the early craftsman, incompatible with modern conditions. True spontaneity, however, seems to come from working by rule, but not being bound by it.

For example, the old Herbal from which figs. 35 to 141 are taken contains many woodcuts of plants, &c., devoting a complete page to each. When long explanation of a cut is required, a smaller type used (comp. figs. 135 & 138); when the explanation
Special Subjects is very short, *it does not fill the page*. This is a free and natural treatment of the greatest convenience to the reader, for illustration and text are always in juxtaposition. And though the size of the type and the amount of the text are varied, yet the uniform top margins, and the uniform treatment and arrangement of the woodcuts, harmonise the pages, and give to the whole book an agreeable effect of freedom combined with method.

An old way of treating a text and its commentary is indicated by the diagram (fig. 202). The text is

![Diagram showing arrangement of pages](image)

*Diagram shewing arrangement of pages (about 1/4 size).*

*Note: Inner columns of Commentary narrow (Text cols. equal)*

**Fig. 202.**

printed in large type, the commentary, in small type, surrounds it; such portion of the text being printed on each page as will allow sufficient surrounding space for the accompanying commenta.
that portion. The proportions and treatment of every page are uniform (note, particularly, the uniformity of the upper parts of the pages, five lines of commentary being allowed to enclose the text, bound it above, on every page) with the exception at the height of the text-column varies—one page having as few as three lines of text to the column, other having fifty-nine lines. This free treatment the text gives a charming variety to the pages.

Poetry.—A broader and freer treatment is desirable in the printing of poetry. The original lines and the arrangement of the verses should be more generally preserved. And though the opening lines of a poem may sometimes be magnified by printing them in capitals—which necessitate their division—to sacrifice the naturally varying line to the “even ge” is questionable, and to destroy the form of a poem in order to compress it is a “typographical pertinence” (see p. 95).

DECORATION OF PRINT

MUCH MAY BE DONE BY ARRANGINGIMPORTANT EXT IN “ITS OWN” CAPITALS; OR BY THE OCCASIONAL USEOF EXTRA LARGE CAPITALS.

For special letters or ornaments, woodcuts are used (see p. 364). The early printers generally had simple blocks of ornamental devices which might be used separately, or be built up into a frame order for a whole page—a simple method and effective, if used reasonably.
The judicious use of colour, especially of red (see pp. 127, 144), is very effective. The extra printings required for additional colours may make it worth while (in the case of limited editions) to put in simple initials, paragraph marks, notes, &c. by hand (see pp. 194, 113). The earliest printed books, being modelled on the MS. books, employed such rubrication freely, in spaces specially left in the text or in the margins. There are still great possibilities in the hand decoration of printed books.

The following note on printing, reproduced here by the permission of Mr. Emery Walker, appeared in the Introductory Notes of the Catalogue of the first exhibition of The Arts and Crafts Exhibition Society, in 1888.

"PRINTING"

"Printing, in the only sense with which we are present concerned, differs from most if not from all the arts and crafts represented in the Exhibition in being comparatively modern. For although the Chinese impressions from wood blocks engraved in relief for centuries before the wood-cutters of the Netherlands, by similar process, produced the block books, which were the immediate predecessors of the true printed book, the invention of movable metal letters in the middle of the fifteenth century may justly be considered as the invention of the art of printing. And it is worth mentioning, passing that, as an example of fine typography, the earliest dated [1] book, the Gutenberg Bible of 1455, has new..."
en surpassed. Printing, then, for our purpose, may be considered as the art of making books by means of movable types. Now, as all books not primarily intended as scripture-books consist principally of types composed to form letterpress, it is of the first importance that the lettered should be fine in form; especially, as no more time occupied, or cost incurred, in casting, setting, or printing beautiful letters, than in the same operations with ugly ones. So we find the fifteenth and early sixteenth century printers, who were generally their own typefounders, gave great attention to the forms of their types. The designers of the letters used in the earliest books were probably the scribes whose manuscripts the fifteenth-century printed books so much resemble. Aldus of Venice employed Francisco Francia of Bologna, goldsmith and painter, to cut the punches for his celebrated italic letter. Froben, the great Basle printer, got Holbein to design ornaments for his press, and it is not unreasonable to suppose that the painter may have drawn the models for the noble Roman types we find in Froben's books. With the decadence in handwriting which became marked in the sixteenth century, a corresponding change took place in the types; the designers, no longer having beautiful writing as a model and reference, introduced variations arbitrarily. The types of the Elzevirs are regular and neat, and in this respect modern, but they altogether lack the spirit and originality that distinguish the early Roman types of Italy and Germany: Gothic characteristics inherited from their mediaeval predecessors. In the seventeenth century type-founding began to be carried on as a craft apart from that of the printer, and although this and the succeeding century many attempts were made to improve the "face" (as the printing surface of type is called), such examples as a rule reflect only too clearly the growing debasement of the crafts of design. Notable among these attempts were the founts cut by William Caslon, who started in business in London as a letter-founder in 1720, taking for his models the Elzevir
Special types. From this time until the end of the century his and his successors turned out many founts relatively admirable. But at the end of the eighteenth century a revolution was made, and the founders entirely abandoned the traditional forms of their predecessors and evolved the tasteless letters with which nearly all the books published during the first sixty years of the present century are printed, and which are still almost universally used for newspapers and for Government publications. Particularly objectionable forms are in everyday use in all continents countries requiring Roman letter. (The last two sentences are set in a type of this character.)

"In 1844 the Chiswick Press printed for Messrs. Longmans 'The Diary of Lady Willoughby,' and revived for this purpose one of Caslon's founts. This was an important step in the right direction, and its success induced Messrs. Miller & Richard of Edinburgh to engrave a series of 'old style' founts, with one of which this catalogue is printed. Most other type-founders now cast similar type, and without doubt if their customers the printers, demanded it, they would expend some of the energy and talent which now goes in cutting Japanese, American and sham seventeenth-century monstrosities endeavouring to produce once more the restrained and beautiful forms of the early printers, until the day when the current handwriting may be elegant enough to again used as a model for the type-punch engraver.

"Next in importance to the type are the ornaments initial letters, and other decorations which can be print along with it. These, it is obvious, should always designed and engraved so as to harmonise with the print page regarded as a whole. Hence, illustrations drawn only with reference to purely pictorial effects are entirely out of place in a book, that is, if we desire seriously make it beautiful.

EMERY WALKER."
As the material naturally modifies the shapes of the letters cut or formed on its surface, and as the object bearing the inscription affects their arrangement, it is essential that the inscription cutter make himself familiar with various stones, metals, woods, &c., with the various chisels and gravers which are properly employed on them, and with fine inscriptions or examples of good pieces of lettering (see p. 388, 237).

A knowledge of penmanship will be found useful, and the pen may be appealed to to decide questions of abstract form in regard to letters which have come from pen forms (e.g. Roman Small-Letters, Italics, &c.). And in this connection it may be noted again that the "slanted-pen forms" (pp. 305, 43) are generally the most practical.

Engraving on Metal.—Letters incised in metal may most nearly approach pen forms, as the fine grain of the metal and the comparatively small scale of the work allow of fine "thin strokes." The engraver, however, while following generally the "thicks" and "thins" of the penman, allows the metal and the tool and, to a large extent, his own hand, to decide and characterise the precise forms and their proportions.

Inscriptions in Stone (see Chap. XVII., Plates I., II., and XXIV., and pp. 292, 36).—The grain of stone does not generally allow of very fine thin strokes, and the "thicks" and "thins" therefore tend to differ much less than in pen-work. Their origin, moreover, is much less easily traced to the tool—i.e. the chisel—and the difference was less in the early inscriptions (see Plate II.) than we are now
Special Subjects

accustomed to (see Plate XXIV.): perhaps it may be explained as a fashion set by penmanship (see p. 241).

Inscriptions on Wood are frequently in relief (see raised letters, p. 377), matching the carved ornament. Incised letters may be painted or gilded to make them show more clearly.

Sign-Writing and Brush-Work.—Inscriptions such as shop signs, notices, &c., painted on wood or stone, require—besides a practical knowledge of materials—a considerable facility with the brush or "pencil." Directness and freedom of workmanship are most desirable.¹

A suitable brush will make letters closely resembling pen letters. But the pen automatically make letters with a uniform precision, which it is neither desirable nor possible for the brush to imitate: and greater skill is required to control the brush, which in the hand of a good "Writer" will be permitted to give its own distinct character to the lettering (see also p. 292, and fig. 164).

The brush is properly used for temporary inscriptions, especially on the surface of painted wood or stone, but, for more important work, incising or carving (painted if desired) are to be preferred being more permanent ² and preserving the original form ³ of the lettering.

¹ This is recognised in the Sign-writing profession when I understand, an applicant for work is sometimes given a blackboard or a piece of American cloth, on which he writes out short inscription in "sharp white." It is not necessary to watch the writer; good, direct workmanship shows itself, and also every hesitating stroke or fault, every patch or "touching up" or "going over," is made evident.

² Brush lettering may be used very effectively on Tiles and China, &c. (see p. 339), when it is of course rendered permanent by baking.

³ The original form of a painted inscription (not carved) inevitably spoilt by re-painting.
OF INSCRIPTIONS GENERALLY

(See also Chapter XII., and pp. 350—353)

Alphabets.—For practical purposes the best letters are the Roman Capitals, Roman Small-Letters, and Uncials. These are susceptible of very decorative treatment without loss of legibility. And there are many varieties of the pure Roman Capital (see figs. 13—207), besides the “Gothicised” Roman and the simple “Gothic” Capitals, which are all essentially readable.

Different Sizes of Capitals in inscriptions in wood, stone, metal, &c., are generally kept approximately equal in “weight” (see p. 328). Note.—A downward decrease in height of the letters is common in early inscriptions (p. 410).

Incising is generally the most simple, and therefore the most natural, method for making an ordinary inscription. The letters should be large rather than small, and be deeply cut. Note, however, an incised stamp or die produces an impression in relief on clay, &c. This may be seen in the lettering on Roman pottery.

Raised Letters.—From the earliest times letters in relief (or litteræ prominentes) have been used for special purposes. They are generally rather more legible than the incised letters, and the difference between “thicks” and “thins” tends to disappear.

It is quite possible to make a beautiful and characteristic alphabet of equal-stroke letters, on the lines of the so-called “Block Letter” but properly proportioned and finished (such letters may be raised, or Incised or Painted: see incised form, p. 391).

Raised letters, if exposed to wear or damage, may be protected by being on a sunk panel or having a raised frame or ornament. The background also

may be left in raised strips flush with the letters between the lines of the inscription.

**Punctuation.**—In early inscriptions the words were separated by points; in the more ancient they are square shaped \[\text{WH}\], \[\text{n}\], \[\text{more elaborate, triangular \(\wedge\), \(\Delta\), \(\angle\), sometimes with curved-in sides \(\searrow\) (Plate I.). The developed later into the ivy leaf \(\circ\), \(\odot\),

‘hererae distinguentes.’ Such points may be used occasionally in modern work with fine effect, but should seldom be used between every word, unless the words are *necessarily* so close that distinguishing marks are required.

**Phrasing and Arrangement.**—An inscription may be arranged in sentences or phrases, and occasionally by the use of larger letters, greater prominence given to a word or phrase (see figs. 197, 204, 211). This method is particularly adapted to the nature of a *set inscription* (p. 264), and may help both to readableness and its appearance, but it must be borne in mind that to lay stress on any one statement work may pervert its meaning or attract too much attention to it.

Any confusion of sense, or accidental word (p. 259) or phrase, *appearing in the setting-out* avoided, if possible, by a slight rearrangement of the part, or, if necessary, of the whole inscription. Great care is taken that the spelling is accurate: a pocket dictionary should be carried.

Reading is further facilitated by avoiding, where possible, the dividing of words at the ends of lines. It may be observed that in the more ancient inscriptions words were generally kept *entire*.

384
Exercises in letter form and arrangement, more profitable than mere paper “designing,” might be revised by the craftsman. Inscriptions might be cut on a small scale—in gesso or chalk, or inscriptions might be variously spaced and arranged on a properly coloured surface—such as a drawing-board covered with light or dark cloth—in letters cut out of sheet-fat or card.

Original MSS. or Inscriptions—from which one can learn much more than from photographs or drawings—may be found in most parts of the country, and in London especially in the British Museum, South Kensington Museum (see p. 39), the Record Office (Rolls Chapel, see p. 11), Westminster Abbey (MSS. in the Chapter-House...
APPENDIX B

CHAPTER XVII

INSCRIPTIONS IN STONE

(By A. E. R. Gill)

ARRANGEMENT

Inscriptions are carved in stone for many uses: Foundation Stones and Public Inscriptions, for Tombstones and Memorial Inscriptions, for Mottos and Texts, for Names and Advertisements, and each object suggests its own treatment.

Colour and Gold may be used both for the beauty of them and, in places where there is little light, to increase legibility.

Arrangement.—There are two methods of arranging Inscriptions: the "Massed" and the "Symmetrical." In the former the lines are very close
Inscriptions in Stone together, and approximately equal in length, and form a mass (see fig. 205). Absolute equality is quite unnecessary. Where the lines are very long it is easy to make them equal; but with lines of few words it is very difficult, besides being derogatory to the appearance of the Inscription. In the “Symmetrical” Inscription the length of the lines may vary considerably, and each line (often comprising a distinct phrase or statement) is placed at the centre of the Inscription space (see fig. 204).

Short Inscriptions, such as those usually on Tombs or Foundation Stones, may well be arranged in the “Symmetrical” way, but long Inscriptions are better arranged in the “Massed” way, though sometimes, the two methods may be combined in the same Inscription.

THE THREE ALPHABETS

The Roman Alphabet, the alphabet chiefly in use to-day, reached its highest development in Inscriptions incised in stone (see Plate I.).

Besides ROMAN CAPITALS, it is necessary that the letter-cutter should know how to carve Roman small-letters (or “Lower case” and Italic), either of which may be more suitable than Capitals for some Inscriptions.

Where great magnificence combined with great legibility is desired, use large Roman Capitals.

---

1 With which we may include Arabic numerals.

2 It should be clearly understood that legibility by no means excludes either beauty or ornament. The ugly form of “Block letter so much in use is no more legible than the beautiful Roman lettering on the Trajan Column (see Plates I., II.).
Incised or in Relief, with plenty of space between the letters and the lines.

Where great legibility but less magnificence is desired, use "Roman Small-Letters" or "Italics."

All three Alphabets may be used together, as, for instance, on a Tombstone, one might carve the Name in Capitals and the rest of the Inscription in Small-Letters, using Italics for difference.

Beauty of Form may safely be left to a right use of the chisel, combined with a well-advised study of the best examples of Inscriptions: such as that on the Trajan Column (see Plates I., II.) and other Roman Inscriptions in the South Kensington and British Museums, for Roman CAPITALS; and sixteenth and seventeenth century tombstones, for Roman small-letters and Italics.¹ If the simple

“A” with & without serifs.

Fig. 209.

¹ Roman small-letters and Italics, being originally pen letters, are still better understood if the carver knows how to use a pen, or, at least, has studied good examples of manuscripts in which those letters are used.
Inscriptions in Stone

elementary form of the letter be cut firmly and directly, it will be found that the chisel will suggest how that form may be ornamented. This may be shown, for example, by an attempt to carve a quite simple Incised letter with no Serifs and with all the strokes equally thick. In making the ends of the strokes nice and clean it will be found that there is a tendency to spread them into Serifs, and the letter is at once, in some sort, ornamented (see fig. 209).

SIZE & SPACING

Drawing out.—Take paper and pencil, or what you will, and write out the words of the Inscription in Capitals, or small-letters (or both), without any regard to scale or the shape of the space the Inscription is to go in. The carver will then see easily of what letters and words his Inscription is composed. Next draw the shape of the Inscription space (say to 1 inch or 1½ inch scale), and in that space set out the Inscription, either "Massed" or "Symmetrical," as has been decided. The drawing should be neither scribbled nor elaborated. The carver will thus be able, after a little experience, to calculate quite easily what size he will be able to carve his letters, what space he will be able to leave between the lines, and what margins he can afford.¹

¹ Some advice from the letter-cutter might be useful to the client as to the number of words and the space they will occupy in cases where it is possible to adapt the one to the other.

392
The Size of Lettering depends on where it is to (i.e. outdoors or indoors, far away or near), the material to be used, and the space at the carver’sposal. 

Out of Doors capital letters should, as a rule, be less than 1.4 inch high, more if possible.¹ Indoors smaller lettering may be carved, but even 1 inch is quite small enough, and that only intable, slate, or the finest stones. In such stones as Ancaster or Ham-Hill it is not ssible to carve good letters less than 3 inches high. More than one size of letter may be used in the Inscription to give emphasis to certain words, is: on a Foundation Stone the Date (see fig. 210),

HIS STONE WAS LAID
ON THE 4th OF JULY
1904

**FIG. 210.**

Small lettering is less convenient to read out of doors, and ot to get filled with dirt or moss.
Inscriptions and on a Tombstone the Name (see fig. 211), may be made larger than the rest.

Spacing.—Proper spacing is essential to a good Inscription. As a general rule, Roman letters should not be crowded together. Space should be between each, varying according to the letters—narrower space between two O’s, for example, a generally, a wider space between two straight letters. The lines may be about the height of the letter apart (see Plate I.) or pretty close together (Plate XXIV.).

Margins.—If the Inscription is to be carved in a panel, the surrounding mouldings take the place of margins, and the lettering may fill the panel (fig. 211). If any space be left, let it come, a
naturally will, at the bottom. If the lettering is not to be in a panel, the margins depend primarily on what the carver can afford, and where the Inscription is to go. Every case must be treated on its own merits, but as a general rule one may say that the bottom margin should be the widest and the top margin the narrowest.

THE MATERIAL

The best quality a stone can have, from a letter-cutter's point of view, is fineness or closeness of texture, combined with freedom from holes and flints or occasional shells, and the letter-cutter will do well to choose the stone himself, if possible, having regard to this quality.

The following is a list of a few of the best stones for outdoor and indoor use:

**Outdoors or Indoors.**

Portland.—Good for lettering: excellent weathering qualities: becomes quite white if exposed to wind and rain, thus showing very clearly any differences of light and shade.

Especially good for lettering: fine and hard: good weathering qualities. Great delicacy may be attained in these.

Essex.—Done in these.

Essex.—Done in these.

Marbles and Alabasters.—Excellent for inscriptions indoors, but much colour or veining tends to confuse lettering.

**Indoors only.**

Clunch Very fine and delicate work may be done in these.

Bath.—A cheap stone, and easily carved; but unsuitable for small lettering.

Marbles and Alabasters.—Excellent for inscriptions indoors, but much colour or veining tends to confuse lettering.

**Inscriptions in Stone**

395
In "Setting Out," the spacing of the letters is thought of rather than their forms. And though the beginner may find careful drawing helpful, the forms which may best be produced with the chisel are found only by practice and experience (p. 399).

TOOLS

The chisels needed for simple work are flat chisels of the following sizes:—

- $\frac{1}{16}$ inch, $\frac{1}{4}$ inch, $\frac{3}{8}$ inch, $\frac{1}{2}$ inch, 1 inch.

The shanks should be about 7 inches long.

It will be found useful to keep a few "Bull nosed" chisels (see 7, fig. 212) for use in cutting curves, and a few "skewed" chisels (8, fig. 212) for use in cutting the background of Raised letters as a chisel of that shape is more easily used in a corner.

The chisels are either Hammer-headed or Mallet headed, or they may have wooden handles (see fig...
The Hammer-headed are the most used, and a good number should be procured. Inscriptions in Stone

1 Wooden-handled.
2 Section of No. 1.
3 Straight Hammer-headed.
4 Enlarged section of No. 3.
5 Section of Hammer head enlarged to show cup.
6 Mallet-head.
7 "Bull-nosed."
8 "Skewed."

FIG. 212.

The best are made with cupped ends, to prevent them from slipping on the hammer (see 5, fig. 212).
Inscriptions

Temper and Sharpness. — Above all things the chisels must be of the right temper, and sharp.

They are tempered by a smith or tool-maker— if the craftsman can do it for himself, so much the

1 Really sharp, i.e. sharp enough to cut a piece of paper without tearing it.
They are sharpened on a piece of *Grit-stone* (hard York stone, for instance) with water. The temper of a chisel may be seen by the colour it shows a soft or low temper, straw colour a hard or high temper), and felt by the way it rubs on the Grit-stone (a hard tool will slide easily over the stone, while a soft one will seem to stick or drag).

**Mallets.**—A wooden mallet or *Mell*, a Zinc mallet or *Dummy*, and an iron or steel hammer are required (fig. 213).

The *Mell* is made wholly of wood, and should, for letter cutting, be about 5½ inches in diameter.

The *Dummy* has a head of zinc and a wooden handle. It should be about 2½ inches in diameter.

The hammer should be about the same size and weight as the Dummy.

**A RIGHT USE OF THE CHISEL**

The workman must find out, for himself, how to use his tools. In the ordinary way, it is best to hold the chisel at an angle of about 45° with the face of the stone—in the manner shown in fig. 4—in cutting both straight stems and curves. The chisel is held firmly (usually in the left hand, with the little finger about an inch from the cutting edge of the chisel), tapped rather than banged, and lightly rather than heavily.

The best way to cut an ordinary letter is to start the left-hand side at the bottom, and, working towards, to cut the left side of the stem first. Similarly cut the right side of the stem, and then cut the ifs (see fig. 218).
Inscriptions in Stone

When cutting a curve, cut the inside first (fig. 214), and start as near the narrowest part of the curve as possible.

In Incised letters unnecessary junctions of the parts may be avoided (see fig. 215). Where they are necessary, as in a capital E, or in a small y, or...
way from the junction or down on to it, rather than towards it.

Inscriptions in Stone

Note points A, A.

showing how junctions may be avoided in stone.

FIG. 215.

The Mallet-headed and wooden-handled chisels used with the Mell for large work and for cutting surfaces.
Inscriptions in Stone

The Hammer-headed chisels are used with the hammer for ordinary work, and with the Dummy for small and delicate work.

A Mallet or Dummy is not used in carving chalk, but the chisel is pushed; the right hand doing the pushing, and the left hand guiding a
teadying the chisel (see fig. 216). If the chisel were struck, the surface of the chalk would flake off.

In cutting an Incised Inscription with the ordinary “V” section (see fig. 217), use one size of chisel throughout. The width of the chisel should generally be about the width of the letter stem required. More elaborate sections necessitate the use of several sizes of chisels.

INCISED LETTERS & LETTERS IN RELIEF

Inscriptions may be Incised or in Relief, that is, sunk or raised.¹ The modus operandi and the time spent in carving the actual letters are the same in either case, but whereas when the Incised letter is carved there is nothing more to be done, after the carving of the Raised letter there is still the stone surrounding it (i.e. the background) to be dealt with, and this should simply be carved smooth.²

Other things being equal, it becomes a question of economy which form of lettering one will carve, the necessity of dealing with the background of Raised Inscription, while more than doubling the opportunities of the carver, at least doubles the time spent in carving.

Raised lettering will show out more clearly than Incised lettering where there is little light.

¹ In learning to cut Inscriptions one would naturally begin with Incised letters.
² Where the ground between the letters is left plain, an absolute flatness and evenness is not necessary. The common method of jabbing or “pecking” the background is objectionable.
Inscriptions in Stone

Roman Capitals are more adapted for carving in Relief than are Roman small-letters or Italics, which are directly derived from the pen.

Raised lettering is more allied to ordinary carving while Incised lettering may be thought of as writing in stone.

1 For ordinary work.

2 For large work.

3

4 For gilding.

5 For ordinary work.

FIG. 217.
THE SECTIONS OF LETTERS

For Incised letters, a “V” section (1, fig. 217) of out 60° is best for regular use; deeper rather than allower. The letters may with vantage be cut a little deeper wards the Serifs (see fig. 218). Although the simple “V” sec-
ction is the most useful, other sections may be used for large letters (i.e. letters more than 6
ches high), or letters in a very
ce material (2 & 3, fig. 217). If the lettering is to be gilded, d the stone will permit of it,
ction 4 (fig. 217) is a good one to use. Only the curved part is to be Gilded, and not the small bevelled sides.

For Raised letters, the best and most useful section No. 5; the slightly bevelled sides tell as part of the ter. Experience, and the weathering conditions, will suggest the amount of Relief to be given. For letters 1½ inch high, out of doors, 1/6 inch of relief ample, and if there be good light ½ inch is enough. Excessive relief looks clumsy.

Sections Nos. 6 and 7 are suitable only for large letters; and elaborate sections should as a rule be ed only for letters standing alone.

WORKING IN SITU

If possible the carver should work in situ. When at is impracticable, he should consider most care-
ly where his Inscription is to go.

E.g. Tombstones and Memorial Slabs are not usually fixed til finished.
In an Inscription which is much above the eye level, the letters may be narrower in proportion to their height, and the horizontal strokes extra thick to allow for foreshortening. (See also pp. 351, 270.)

The advantages of working *in situ* are great, for by so doing the carver sees his work under the same conditions of light and environment that it will finally be seen under.
NOTES ON THE PLATES
NOTES ON THE PLATES

[Note.—In order to make the illustrations [whether of facsimiles or enlargements] as large and as full as possible, I have sacrificed appearance to use and allowed most of the plates, and many of the diagrams in the book, to encroach on the margins.

E. J.]

GENERAL NOTE.—All the plates are in facsimile as size (or nearly so, allowing for errors in reproduction) except I., II., XXII., and XXIV., which had to be reduced, and, therefore only portions of the MSS. can be given. Note.—All the MSS. are on "Vellum" (see 173). In order to get a better impression of the size and general proportion of a MS., the student might construct it—or at least mark off the margins, text, etc.—on paper, from the measurements given. Or a jet of paper might be cut to the size of the given page opening, with an aperture (in its proper place) through which the plate might be viewed.

The plates are arranged in chronological order as nearly as possible. They are intended briefly to illustrate the Development of the Formal Book Hands from the Roman Capital and the General Development of the Illuminated MS.: I hope, moreover, that, fragmentary as they are, they will prove usefully suggestive in regard to the arrangement of Text and Lettering and Ornament. The wonderful effect of the colouring cannot be given here, but, in any case, the illuminator should look at some original MSS. Several of the MSS. from which the plates are taken are exhibited in the British Museum.

THE STONE (within the internal line of the building): 3 feet 9 inches high, and 9 feet 3/4 inch long.

There is a cast (No. 1864–128) in the Victoria and Albert Museum, South Kensington, where also the photograph of the inscription is obtainable, from portions of which Plates I. and are reproduced.
Notes on the Plates

THE BORDERS.—The lettering practically fills the panel (see p. 352): the surrounding moulding is approx. 4 inches wide.

THE LETTERS (for their forms see note on Pl. II.):

Approximate heights

- First two lines: 4\frac{1}{2} inches high.
- Second two lines: 4\frac{2}{4} inches.
- Fifth line: 4\frac{1}{2} inches.
- Last line: 3\frac{3}{8} inches.

THE SPACES (between Lines) decrease from 1\frac{1}{4} inches to 2\frac{3}{4} inches. A decrease in the height of the letters from the top to the foot line is common in early inscriptions (see figs. 203–205). Several reasons for this suggest themselves: (a) (Sometimes the beginning words, being farther from the reader, may require to be larger). (b) The architectural beauty of a large heading (comp. stem heads, p. 288). (c) The importance of beginnings generally (there is very often a marked difference between the upper lines containing important words and the rest of the inscription: comp. figs. 197, 91).

Note.—The WORDS are separated by triangular points (p. 384).

PLATE II.—Alphabet from Trajan Inscription. (Circa A.D. 114). Scale approx. \frac{1}{5}th linear. (See note above.)

THE “TRAJAN” ALPHABET.—Very fine letter for inscriptions in stone: possibly painted before incision (see p. 292); see also remarks on Roman Capitals, pp. 268, 296, and note:—

SERIFS.—Small and carefully curved.

THIN PARTS about half the width of the thick stems (pp. 375, 285).

A (M and N), pointed (p. 280).
B—a very beautiful form, with large lower bow (p. 278).
C, G, and (D)—Upper parts rather straight (p. 281).
E and F—mid arm slightly shorter than upper arm.
E and L—lower serif pointed out (p. 282).
LO (shown sideways in plate) and LT show L's arm projecting under next letter.

M—pointed: slightly spread (p. 284), distance apart of points above equal to inside distance of stems below.

N—pointed: practically no difference in thickness of vertical and oblique parts (p. 285).

O—very beautiful: width slightly less than height (p. 270); ghtly tilted (as are all the other curved letters: see p. 285).

P—Bow not joined to stem below (first P rounder topped).

Q—tail carried under v (u).

R—large bow: straight tail, with finishing-curve (p. 291).

S—leans forward slightly (p. 286).

\[
\begin{array}{c|c|c|c|c|c}
\text{Letters} & \text{CDGMNQ} & \text{ARTV} & \text{BX} & \text{P} & \text{LS} & \text{EF} \\
\text{Widths} & \text{width slightly less than height.} & \text{width approx. } \frac{1}{4} \text{th less than height.} & \text{width rather more than half height.} & \text{width approx. equal half height.} & \text{width slightly less than half height.} & \text{width approx. } \frac{2}{3} \text{ths of height.}
\end{array}
\]

H, (J), K, (U), W, Y, Z are not present in the scription. A rough diagram (fig. 219) is given below owing approximately suitable forms for these (Re action of u in stone; see p. 400, & fig. 215).

\[\text{FIG. 219.}\]
Notes on the Plates

**PLATE III.—Written Roman Capitals, Fourth or Fifth Century.** (Virgil’s "Æneid").

(From a facsimile in the Palæographical Society’s Publications, 1st Series, Vol. II., Pl. 208, of a MS. in the library of S. Gall, Switzerland. See also “Greek and Latin Palæography,” p. 185.)

**LETTERS.**—Simple-written (slanted-pen) Roman “Square Capitals.”

**WORDS in early MSS. were not separated** (p. 112).

**LINES** ruled with a hard point (p. 343). The letters appear to have been written between every alternate pair (p. 299), but slightly over the line.

A very handsome writing which might still be used for special MSS. (see pp. 304, 300, 299).

**PLATE IV.—Uncial Writing, probably Italian Sixth or Seventh Century.** (Latin Gospels.) Brit. Museum, Harl. MS. 1775.

(Shown in Brit. Mus. Department of MSS., Case G, No. 11.)

**THE VOLUME** contains 468 leaves (7 inches by $\frac{3}{4}$ inches).

**MARGINS, Approx.:** Inner $\frac{5}{8}$ inch, Head $\frac{7}{8}$ inch, Side $\frac{9}{8}$ inch, Foot $\frac{5}{8}$ inch. (They may have been cut down by the binder.)

**WRITING.**—A fine round Uncial MS. (pp. 38, 302), arranged in long and short lines.

**Note.**—On many of the letters there are fine hair-line curved tails and flourishes, which are scarcely visible in the photograph. (These tails were also used in the earlier Uncial shown in fig. 5—see also Addenda, p. 23.)

**SECTIONS.**—Marked by built-up letters of an Uncial type, and numbered, mr cxxiii to mr cxxvi (with reference to "Harmonics"). The passage is S. Mark xi. 21–25.
LATE V.—Uncial Writing, probably Continental
Seventh Century. (Gospel of S. John). Ex libris
Stonyhurst College. (See also enlargement, fig. 169.)

(From a facsimile in the Palæographical Society's
publications, 1st Series, Vol. II., Pl. 17.)

THE VOLUME contains 90 leaves, approx. $5\frac{3}{8}$
ches by $3\frac{5}{8}$ inches. The Inner margin is approximately
inch wide.

WRITING.—A very beautiful pointed (slanted-pen)
cial. The "pointed" character of the letters, which
retain their typical roundness, give this writing a
icular charm. Note the top of the P has a marked
gle, and the M and H, and even the O, have this
ightly or strongly.

RULING.—Single lines, rather wide (p. 305).

ARRANGEMENT.—Certain of the lines are indented
the letter (p. 264).

LARGE LETTERS.—On verso Col marking a
Chapter" is built-up in red, on recto the three large
letters (marking sections) are simply written with the text
(p. 299). (The passage is S. John xi. 46–56.)

LATE VI.—Half-Uncial (Irish), Seventh Century.
"Book of Kells" (Latin Gospels). Ex libris Trinity
College, Dublin.

(From a facsimile—part of Pl. XLVII.—in "Celtic
ornaments from the Book of Kells," by the Rev. Dr.
K. Abbott.)

THE LEAVES—which are cut down and much
maged—measure 13 inches by 10 inches.

WRITING.—A beautiful and highly finished (approx.
taight pen) Half-Uncial (pp. 40, 304), tending to orna-
tental and fanciful forms whenever opportunity offered.
Note the treatment of inde.)

ARRANGEMENT.—Long and short lines: wide
acing.
Notes on the Plates

THE LETTERS combine extreme graceful line with an unusual appearance of strength. This is mainly due to the ends of all the strokes being finished; thick strokes have large, triangular heads (p. 327) on the left, and bases broadened by an additional stroke below on the right (thus \( / \)). And the horizontal thick strokes are either finished with a triangular terminal (p. 246), or run on into the next letter—joining the letter together.

The extreme roundness of the letters is contributed by their being written between DOUBLE LINES (p. 304, 88), the upper line of which tends to flatten the top. The pen not being quite "straight" (see footnote p. 304) together with a tendency to pull the left hand curves, gives a characteristic shape to the letter

\[ \text{a c d e q t} \]

THE ILLUMINATION throughout the book is most elaborate and beautiful. Each division has an entire Initial page occupied with the first few letters. The COLOURS were "paled green, red, violet, an yellow, intense black, and white, but no gold": see description of Celtic MSS., p. 40, Bradley's "Illuminated Letters and Borders," and also the Palæographic Society's 1st Series, Vol. II., Pl. 55–58, 88, 89.

This notable book may be taken as an example of the marvellous possibilities of pen-work and complex colour work (see p. 216).

In considering the value of the writing as a mode it may be noted that its highly finished nature demands practised skill on the part of the copyist, and that though modern Irish writing (for which it would be an excellent model) still employs \[ \text{a d f g j r t} \] these letters would be apt to look peculiar in English. The Keltic MS. \[ \text{a c e h m n o p q n s u} \] however, might be used, and a very beautiful ornament hand (p. 304) might be founded on this writing.

414
LATE VII.—Half-Uncial (English), circa a.d. 700

THE VOLUME contains 258 leaves (13\ 1/2 inches by 9\ 5/16 inches).

THE WRITING is an English—or rather Anglo-Saxon—Half-Uncial, written at Lindisfarne (Holy I.) under Irish influence (p. 40). ARRANGEMENT—two columns of 24 lines—long and short—to the page (note how is got into the fifth line): wide spacing.

The writing bears a strong resemblance to that of the “Book of Kells,” but is generally much plainer; it is so less graceful, being heavier and wider in proportion. The “Book of Kells” O is a circle, while the “Durham Book” O is considerably wider than its height, and all the other letters are correspondingly wide. The RULING in both books consists of double lines, ruled with a hard point on both sides of each leaf.

THE ILLUMINATION also resembles that of the “Book of Kells” (see opposite), but a small amount of is employed in it. (See also Palæographical Society’s 2nd Series, Vol. II., Pl. 3–6, 22.)

Note.—The “Gloss,” or interlinear translation, is in the Northumbrian dialect, and was put in in the tenth century, more than 200 years after the book was written.

A hand founded to some extent on the “Durham Book” hand is given in Chap. IV. as an easy copy: see ps. 49, 50.

LATE VIII.—English Tenth-century Writing. (Psalter.) Brit. Mus., Harl. MS. 2904. (See enlargement, fig. 172.) (Shown B. M. Grenville Lib. Case 1, No. 9.)

THE VOLUME contains 214 leaves (13\ 1/4 inches by 9\ 3/8 inches), 18 lines to the page; probably written at Winchester in late tenth century. (Pl. reduced scale 8\ 9ths.)

WRITING.—An extremely good, formal, “slanted” writing, having great freedom (note the very slight slope forward) and simplicity. This type of letter may
Notes on the Plates be regarded as a link between the Half-Uncial and the Roman Small-Letter (see p. 310).

THE RULING: single lines (see footnote, p. 305).

THE LETTERS show very strongly the effects of the "slanted pen" (see pp. 43, 305). Note the hea shoulders and feet in n, b, &c., and the thick horizont in rC. The curved tops or arches are flattish and stron the thick strokes end abruptly in points, in d, (h), i, r, n, u forming small (and in l, C large) heavy hooks belo The thin stroke scarcely appears, except as a finish, e.g. a, or an accidental. Note generally the tendency to inter angles and external roundness (examples f and o).

Note particularly the junctions and accidental crossing of the strokes (seen best in the enlargement, fig. 172) bearing on the mode of construction of the letters (e p. 84).

Note the fine shape of the amperzand (&: 3rd line).

THE ILLUMINATION (see Characteristics Wincherton Illumination, or "Opus Anglicum," pp. 82, 8 Bradley: "Illuminated Letters and Borders"). All CAPITALS beginning the verses are in raised, burnish gold, in the margin. The titles are in red in fancy "Rus Capitals" (p. 297). The Line-Fillings consist of group of red dots, in threes (.:.:..).

This extremely legible MS. would form an alm perfect model for a modern formal hand (s being subst for long f, and the straight t for the curved C (fig. 183): the removal of the e Tongue would also he readableness). And though it is somewhat large a heavy for ordinary use, it is good for practising, a might be developed into a form resembling any of mo difficult later forms (e.g. Plates IX., X., XX.).

PLATE IX.—English Writing, dated 1018. The portions of a Charter of CNUT. Brit. Museum. (a also enlargement, fig. 173.) [Pl. reduced scale 1/2 t (Shown in Brit. Mus., Department of MSS., Case No. 3.)

THE WRITING resembles that in Plate VI.
see above), but is more slender and rounder—the pen being a little less slanted, and the arches more curved, and showing more of the thin stroke. The ascenders and descenders are longer, the heads are more marked, and there is a general elegance and distinction, due perhaps to the MS. being a charter. Charter-hands are generally more showy and less legible than Book-hands, but in this hand there is great legibility, and a very few ranges (similar to those suggested above) would make it quite suitable for modern use. Its relation to the Roman Tall-Letter is obvious.

Notes.—The (black) \[V\] and \(u\) were probably built-up with the writing pen.

The forms of \(a, e, g, (h), r,\) may be noted as differing considerably from the tenth-century hand.

The combined \(ra\) (in the 4th line) is curious; and the in Anglorum—this \(r\) (which represents the Bow and all of \(R\)) commonly follows the round letters \(b, o, p,\)

“Gothic” writing: there is another curious form in the linked \(rt\) in cartula (last line).

The word CNUT and several other names are in namental “Rustic” Capitals (see p. 297).

The two lines of English from another part of the charter have very long stems and ornamental serifs, giving very decorative effect (see footnote, p. 326).

LATE X.—Italian (first half of) Twelfth-century Writing. (Homilies and Lessons.) Brit. Mus., Harl. MS. 7183. (See also enlargement, g. 174.)

Shown in Brit. Mus., Department of MSS., Case C (lower part), No. 101.)

THE VOLUME.—Homilies and Lessons for Sundays and Festivals from Advent to Easter Eve—contains 77 leaves (approximately 21\(\frac{1}{2}\) inches by 15 inches); 70 columns, each of 50 lines, to the page. The [margins are, approximately, Inner 1\(\frac{1}{4}\) inch, Head 417
Notes on the
Plates

Notes on the ij inch, Side 3½ inches, Foot 4½ inches (between column 1⅛ inch: see Plate). The portion of a page, shown in Plate X., consists of the last eleven lines, second column of folio 78.

WRITING.—This has all the qualities of good writing (p. 239) in a marked degree, and I consider it taken all round, the most perfect and satisfactory penmanship which I have seen.

Its simplicity and distinctiveness are very marked, also are its character and freedom. There is an almost entire absence of artificial finish—the terminals are natural hooks, beaks and "feet" made with a fine sleight of hand (p. 311)—and its very great beauty of form is the natural outcome of good traditions and eminently satisfactory craftsmanship.

Notes.—The letters are very wide, and the insi shapes differ considerably from those of the tenth-century MS. (above)—with which, however, there is a considerable affinity (see p. 416).

The f is longer than the f, the g has a very fine form with a closed loop, the r is sharpened, the t straight.

Small (Uncial) CAPITALS um follow the Versals; the serifs on the S and E are made with dexterous movements of the nib (p. 246), and resemble those on the Versal C. V and U are both used for the consonant (V).

There are very few VERSALS in this book: the shown is in red (which has been smudged).

The large "ILLUMINATED INITIALS" in the book are in yellow, blue, and red, and appear to me to be comparatively poor, at least, to fall short of the perfection of the MS.

Of this writing, Sir Edward Maunde Thompson ("Greek and Latin Palæography," pp. 271–2) says:

"The sense of grace of form which we perceive in the Lombardic writing of Italy is maintained in that country in later writing of the new minuscule type, which assumes under the pens of the most expert Italian scribes a very beautiful round even style. This style, though peculiarly Italian, extends its influence abroad, especially to the south of France,"
came the model of Spanish writing at a later time. We select a specimen from a very handsome MS. of Homilies of the first half of the 12th century (Pal. Soc. ii. pl. 55), written in old letters of the best type, to which we shall find the scribes of the fifteenth century reverting in order to obtain a model for their MSS. of the Renaissance. The exactness with which the writing is here executed is truly marvellous, and was only equalled, not surpassed, by the finished handiwork of its later imitators.

"It will of course be understood that this was not the only style of hand that prevailed in Italy. Others of a much rougher sort were also employed. But as a typical book-hand, which is the parent of the hands in which the greater proportion of carefully written MSS. of succeeding periods were written in Italy, it is to be specially noticed."

(P. 284)—"we give a specimen of a hand of the Italian Renaissance, a revival of the style of the eleventh or twelfth century, and a very successful imitation of a MS. of that period. This was of course, followed by the scribes of the Renaissance, reverting to that fine period of Italian writing (see p. 272) to model for the exquisitely finished MSS. which they were compelled to produce in order to satisfy the refined taste of their day, that influenced the early printers of Italy in the choice of their form of type."

(P. 285)—"in the comparatively small number of extant MSS. of a later date than the close of the [fifteenth] century it is noticeable that a large proportion of them are written in the style of the book-hand of the Italian Renaissance, the style which eventually superseded all others in the print-press. The scribes of these late examples only followed the taste of the day in preferring those clear and simple characters to the rough letters of the native hands."

* The specimen hand given is of date 1466. Plate XVIII. may here be taken as an example of the Renaissance revival; see XX. and fig. 175 as examples of later MSS.

**LATE XI.**—English (late) Twelfth-century Writing, with flourished Capitals. (Breviary.) Brit. Mus., Royal MS. 2. A.x.

Shown in Brit. Mus., Department of MSS., Case D, No. 111.)

THE VOLUME—sometimes called the St. Albans Albanus Breviary—contains 200 leaves (6½ inches by
Notes on the Plates 4\(\frac{7}{8}\) inches); twenty-seven lines to the page, some pages have two columns. MARGINS approximately, Inner \(\frac{5}{8}\) inch, Head under \(\frac{1}{2}\) inch (see Plate), Side 1\(\frac{1}{4}\) inch (part occupied by Versals), Foot 1\(\frac{3}{4}\) inch.

THE WRITING is fairly legible, but approaches Black Letter (p. 331) too nearly to be of use to us for ordinary purposes. Note the ornamental Semi-Rus Capitals in text. Note the RULING of the two half lines and of the foot line is carried into the margin.

THE VERSALS.—The main interest lies in the varied forms of the Versals, which are most beautiful when made in red and green alternately. There is one elaborately gold initial in the book, and several Versals in blue and white (hollow: see p. 208).

The five \(\delta\)'s—and the D in the text—on this page (folio 85b) by no means exhaust the varieties of D alone, and there are very many varieties of the forms of other letters. On some pages each line begins with a small Versal, while the more important Initials are much larger, varying in size and ornament.

THE CONSTRUCTION of the Versals is usually slender, curved, and gradated. A rather fine pen seems to have been used (p. 292), and though the letters are upright, the natural tendency to slant the pen can be detected in the thickening of the thin parts—above, on the right, and below, on the left—giving the suspicion of a drift to the O.

The O-part of each \(\delta\) was made first, and the tail added. This is very obvious in the D in the text, where a stem \(\mid\) was added to O to make D.

Note the dots inside the Versals, one above and one below. Originally these may have been intended for effect—or hide—the junction of the thin strokes, by a twirl of the pen at the end of the first stroke and beginning of the second, thus ( ). Their use is very common in Versal forms (see fig. 189), and besides being decorative in the ordinary sense, they may be said...
strengthen the thin parts (much as the weakest part of the loop in an old key was thickened for strength).

Note the right-hand Bows of the \( \sigma \)'s are made thinner, though the Rubricator had been afraid of running into the text in making their last curves—such an expert, however, may well have had a better reason for it.

**PLATE XII.**—Illuminated Initial in a Flemish MS.

Shown in Brit. Museum, Department of MSS., Case C, No. 91.)

THE VOLUME—the third, and most interesting, of this MS. Bible (Numbered 14788–89–90)—contains 23 leaves (17 inches by 11\( \frac{7}{8} \) inches). MARGINS, approximately, Inner 1\( \frac{1}{8} \) inch, Head (cut) 1 inch, Side 2\( \frac{3}{8} \) inches, Foot 3\( \frac{1}{8} \) inches. (Between columns \( \frac{1}{8} \) inch.)

THE WRITING is a not very legible "Gothic." The zigzag tendency exhibited, especially by the word Niniveh, second line, is unsuited for such formal writing (see p. 484). The rapid placing of the Heads of the letters is such that they appear broken and partly detached from the stems. The VERSALS are of a good type.

THE INITIAL is a monogrammatic ET. The arms of the round \( \Theta \) terminate in leaves folded back, its form is hollow and invovened (p. 208), and gives rise to foliage, which fills the interior—passing over the fish and behind Jonah. Note also how the jaws of the fish are interlaced, and how compactly all the parts are put together.

The close application of the background to the curves adds to the general compactness, and, together with its spacing from the straight front, balances the masses (p. 424): it may be compared to the even spacing of curved and straight strokes (see fig. 53). There is an extension of the background to hold the fish's tail.
Notes on the Plates

THE COLOURS—
Initial, Foliage, Fish: red: \{ outlined \} Parchment
Jonah: black: & lined \{ left plain.\}
Bands on Initial,
Hollows in Initial, \{ gold, outlined red.\}
Backs of folded leaves:
Outer background: paled green.
Dots on outer ground: red.
Inner background: paled blue.

We may not, I think, attempt to imitate the comple-
12th-century decoration of this initial (see p. 196), b
the treatment of the elements of form and colour is ve
suggestive, and the whole piece of lettering is characteris-
the grand style in which a book was at that time begu
The ARRANGEMENT of the letters themselves
very simple, and might be made good use of (fig. 220).

tatem magnam. \& pr(a)edica in ea.}

422
PLATE XIII.—English (2nd half) Thirteenth-century Writing and Illumination. (Latin Bible.) Ex libris S. C. Cockerell.

THE VOLUME—probably written at York—contains 427 leaves (8 inches by 5½ inches): two columns to the page: MARGINS, approx.: Inner ½ inch, Head 1 inch, Side ½ inch, Foot 1⅛ inch. (Between the columns ⅛ inch.) The pages have been cut down. THE WRITING is very small, and there are many contractions.¹ In the thirteenth and fourteenth centuries the whole Bible, written in this fashion, was often small enough to be carried in the pocket. Note the closed a and the 7 form of &. The page is RULED with 50 lines; the 49 lines of writing lie between these, so that in each case the ascenders touch the line above, and the descenders, the line below. Note the double lines in the foot margin (see p. 343).

VERSALS.—A very narrow type is used in the arrow margins: the example shown is in red, flourished blue; it begins the second chapter (Et Angelo ephesi, &c.), which is also marked by coloured Roman Numerals at the side (II). The page heading is “APOCA” in small red and blue Versals.

THE ILLUMINATED INITIAL is “historiated”—i.e. it contains a picture illustrating the text, viz. representation of S. John writing to the Seven Churches—purely conventional forms, or rather symbols, for the lost part, are used and beautifully fitted into the available space. The greater size and more careful drawing of the human figure (the centre of interest) is characteristic of a fine convention. The slope of the vellum page on which S. John is writing, and even the manner in which the quill is held, are such as would naturally be employed by a scribe (see frontispiece, & p. 67).

¹ The Apocalypse here begins “APocalipfis iHu x” (for IUI XΠ, derived from the Greek and used as a mediæval Latin in traction for Jesu Christi).
Notes on the The capitals of the pillars mark the position of the cross-bar of A. The top serif is carried up and forms a bud, which gives rise to leaf-like flourishes; the front serif runs down forming a grotesque, which gives on a leaf-like tongue. In either case the object—in every sense recreative—is a renewal of interest in the designer, elongated, growth of the forms.

Note the curved thickening of A's left stem ends nearly level with the foot of the right stem. This gives balance to the letter (see R, fig. 81 & A, fig. 189), and preserves the essential form, which suffers no distortion by the thinner continuation below.

Note the balancing of the background mass on the straight and curved sides of the Initial (as in Plate XII see above); also the extension and shape of the background accompanying the drawn out parts of the letter.

COLOURS of Initial—

Right stem: \textit{red} \{ with \textit{white} lining.
Left stem and serif: \textit{blue} and patterns.
L. stem, lower half, & dragon: \textit{pale "lake."}
The background: \textit{blue}.
(counter-
charged) lower extension: \textit{blue}.
final flourish: \textit{pale "lake."}
Band (dark) down left side, dragon's wings, 6 "berries," \textit{burnished gold}.
halo, seat, tops of pillar caps: \textit{red}.
Leaves (dark) & pillar caps: \textit{green}.
Small stems & leaves: \textit{green}.

Here again no natural work would come of a mode attempt to imitate so complex a "design"—natural an even inevitable \textit{600 years ago}. But the spirit of delica and fantasy, the ingenious contrivance, and the balance and disposal of form and colour shown by the antiqu art, may well be matter for imitation by the mode draughtsman-illuminator, and even by the mere penma

424
THE LINE-FINISHINGS (see p. 205), of which there are very many throughout the book, all in red or blue pen-work, are very varied. Nine kinds are shown on the plate (which represents about a quarter of a page), and three others from the same MS. are given in figs. 7 (b) and 126 (f, g).

The directions of the thick and thin strokes indicate the pen held at right angles to its usual position (almost upside down,” in fact: see fig. 126, g), and the penmanship exhibits great speed and lightness of hand—the rapidity and skill are indeed quite remarkable (e.g. in the Lion in the eighth line).

Note that, though the writing occasionally runs into the margin, the line-finishing stop at the marginal-line.

The photograph shows red dark and blue light: e.g. the Bird is red, the Lion and the Fish are blue. The fifth Line-finishing is a red filigree with blue “berries”—it can hardly be described as a “floral growth,” as the branching’ is reversed: the rubricator gained speed and uniformity by the simple repetition of the whorls all along the line—the upper branches were probably put in afterwards, and the “berries” were added later when he was making the blue Line-finishings.

The more complex decoration (not shown in the plate) in this MS. is inferior to the penmanship: the small background Capitals with which the verses begin—presumably put in by a different hand—are more pretentious, and do not match the Line-finishings.

General Note.—When a space occurs at the end of a line of writing, it is often best to leave it, and in a plain MS., if it be “well and truly” written, there is no objection to varying lengths of line (see pp. 263, 371). But a book, such as a Psalter, divided into many short verses—in which the last line usually falls short of the marginal line—offers a fair field for such simple and effective
Notes on the decoration. (See also pp. 428, 486, fig. 130, and Plates XXIII.)

THE WRITING is a fine, freely formed, "Gothic (p. 331). Note, the i's are "dotted." Note the doubtful MARGINAL LINES (p. 343).

THE SMALL INITIALS are of the "Lombardic type (p. 210), in which the Serifs are much thickened and ornamented. Note the tails of the Q's are turned to the left to clear the writing. The LINE-FILLING match the small initials (p. 193).

THE LARGE INITIAL, &c.—The plate shows the end of the fourteenth and beginning of the fifteenth Psalm (Omine quis habitabit). Note "Arabic numerals (15) in margin.

The tail of the Initial 0 is formed of a dragon, the head of which rests on the O-part: its wings project in the inner margin (and these in the plate, which shows a fragment of a verso page, run into the fold between the pages): the tail (together with the background) descends till a convenient point is reached from which the low scroll-work springs. The tail, wing, and claws above belong to a magpie which is perched on the initial.

THE DRAWING: see reference to this at p. 20 and below.

Sir Edward Maunde Thompson (p. 39, "English Illuminated MSS.") says of this—

"—the Additional MS. 24686 in the British Museum, known as the Tenison Psalter, from its having once formed part of the library of Archbishop Tenison. This psalter is one of the most beautiful illuminated English manuscripts of its time, but unfortunately only in part, for it was not finished in the perf...
style in which it was begun . . . in the first quire of the text where ornamentation is of peculiar beauty. . . ."

"—the progress of the art [since the earlier part of the thirteenth century] . . . is . . . manifest. There is more freedom in the drawing, the stiffness of the earlier examples in great measure overcome; and the pendant has thrown out a branch which has already put forth leaves. A great variety of colours, blue, rose, vermilion, lake, green, brown, as well as burnished gold, is employed in the composition of the large initial and its accompanying pendant and border, and the small initials are of gold laid on a ground of blue or lake, and filled with lake or blue; while the ribbons which fill up the spaces at the ends of the verses are alternately of the same colours and re decorated with patterns in silver on the blue and in gold on the lake."

"The group of the dismounted knight despatching a typhon, which has proved too much for the horse, upon whose dying body the expectant raven has already perched, tinted in lighter colours. It is an instance of the use to which marginal space was put, particularly by English artists, or the introduction of little scenes, such as episodes in romances, games, grotesque combats, social scenes, &c., often drawn with a light free hand and most artistic touch. Without these little sketches, much of the manners and customs, dress, and daily life of our ancestors would have remained for ever unknown to us."

1 It is supposed that the book was at first intended as a marriage gift for Alphonso, son of Edward I.
2 The characteristic over and under arrangement of the typhon’s upper and lower bill, makes this doubtful.

THE VOLUME: one of two (the other numbered 7695), a Latin treatise on the Virtues and Vices (The miniatures, drawings, &c., probably by “the Monk of yères,” Genoa). The vellum leaves have been separated, and are now preserved in paper books. The leaf illustrated shows a margin of vellum of less than 1\(\frac{3}{16}\) inch round (the plate).

The decorative borders are much more naturalistic in
Notes on the form and colouring than any other old illumination that have seen (see reference to Plate XVI, p. 203).

The foliage is a delicate green, the berries are dark purple, the single fruits plain and pale orange-red; the two beetles in crimson and brown are made darker and to prominent in the photograph. The bands of small "Lombardic" Capitals are in burnished gold.

Note how skilfully and naturally the upper corners of the border are managed, and also the beautiful way in which the branches run into and among the text (see p. 213).

THE PAGE 9½ inches by 6½ inches: MARGIN: approx.: Inner 1½ inch, Head 1½ inch, Side 2½ inches, Foot 2½ inches (the edges have been slightly cut down). The marginal lines (from head to foot of the page) and the writing lines are RULED in faint red.

THE WRITING is a late formal "Gothic"—the thin strokes have evidently been added (p. 47). The written Capitals are blotted with yellow (see p. 140). The ILLUMINATED INITIAL Q is in blue, white lined, on a gold ground, contains a blue flower and five ornaments in "lake." The LINE-FILLINGS are blue and "lake," separated by a gold circle, triangle, lozenge.

THE FILIGREE ILLUMINATION springs from the initial in the narrow margin, and from a cent ornament (see "knot," fig. 127) in the wide side margin. The side margins are treated similarly on either page (see p. 213); the inner margins are generally plain. This repetition gives to the pages a certain sameness—which is a characteristic rather than a fault of the treatment.

The border on the recto of the vellum leaf shows through on the verso or back of the leaf. The marginal lines of the first border, however, are freely traced at
followed on the verso (and so nearly hidden) by the second border. This is also suggestive of the more rapid methods of book production in the 15th century.

COLOURS—

Stems, tendrils, &c.: black.

Leave {ivy-shaped
{ lanceolate: } burnished gold, out-plain.
{lined black (p. 187).} furred.

Flowers, buds, centre ornaments, &c.: blue, “lake,” or green tempered with white, and shaded with pure colour; white markings; the forms not outlined.

This type of illumination is discussed in pp. 197–202. Its chief points are its simplicity and rapidity. A penman or a novice in illuminating can, by taking a little pains, beautify his MSS. easily and quickly; and he may perhaps pass on from this to “higher” types of illumination.

PLATE XVIII.—Italian Fifteenth-century Writing and Illumination. (Perotti’s translation of Polybius.) Ex libris H. Yates Thompson.

THE VOLUME consists of 174 leaves (13½ inches by 9 inches); 35 lines to the page. The plate shows a portion of the upper part of the Initial (recto) page.

THE WRITING.—The Capitals are simple-written, planted-pen “Roman”—slightly ornamental—forms. They are freely copied on a large scale in fig. 168: see p. 297. The Small-letters match the Capitals—they are “Roman” forms with a slight “Gothic” tendency. Both these and the Capitals would make very good models for free Roman hands.

THE INITIAL is a “Roman” A in burnished gold. Note the exceedingly graceful shaping of the limbs, the ornamental, V-shaped cross-bar, and the absence of serifs (see fig. 116).
Notes on the Plates

The "White Vine Pattern" (see p. 202), most delicately and beautifully drawn, interlaces with the letter and itself, and covers the BACKGROUND very evenly. The interstices of the background are painted in blue, red, and green, and its edge is adapted to the slightly projecting flowers and leaves. There are groups (...) of white dots on the blue parts of the background.

THE BORDER (of which a small part is shown) is approximately ½ inch wide in the narrow margin—\_\_—of the side of the text—it is separate from the Initial. extends above and below the text, where its depth is greater, matching the greater depth of the margins. Its treatment is similar to, though perhaps a little simpler than, that of the Initial decoration.

"Part of a [verso] page from a book containing the Psalter of St. Jerome and various Prayers, written and decorated by Joachin theus de Gigantibus of Rotenberg in 1481 for Pope Sixtus IV. Joachinus was employed at Naples by Ferdinand I., and there are other fine examples of his work at the British Museum and the Bibliothèque Nationale, Paris. In each of these, as well as in the present book, he states that he was both scribe and illuminator."—[S. C. C.]

THE VOLUME contains 31 leaves (6\frac{1}{2} inches by 4\frac{3}{8} inches): MARGINS, approx.: Inner 7\frac{7}{8} inch, Head 7\frac{7}{8} inch, Side 1\frac{1}{2} inch, Foot 1\frac{3}{8} inch. (The head margin together with the edge of the book-cover, is shown in the plate.)

THE WRITING.—Very clear, slightly slanted-video "Roman." Note the blending of b and p with e and (see fig. 176, & p. 77). The CAPITALS are quite simple and plain, made (in A)NIMA CHRISTI and in the text) in black with the text pen. Note the long, wave...

ORATIO ADDOMINVM NOSTRVM IESVMXPM

INIMA CHRISTI sanctifica me. Corpus christi salua me.
Sanguis christi in ebra me. Aqua lateris christi lava me.
Sudor unius xpi defende me. Passio christi conforta me.
Mors christi libera me. Sapientia christi doce me.
Obone ielu exaudi me. In tua vulnera abscondo di me. Et ne permittas me
cantent hæ psalterium: et
possidebunt regnum eternum:
Vte se digneris deo: O ró
mine deus omnipotens
istos psalmos consecrátos eis
ego indignus de cantare: cu-
pio in honore nominis tui
domine: beate marie virgi-
nis et omnium sanctorum:
tuorum promemiserunt
euanzelista famuloto tuo: et p
genitore meo et genitrice mna.
Per tutto, quel suo mar sospira et piagne,
Percosse in vista oltra lusato offesa;
Tal, ch'ha noia et desdegno hebbi me stesso.
Et se non fusse che maggior paura
Frenò l'ardir; con morte acerba et dura,
Al laqual fui molte fiate presso.
D'uscir d'affanno harei corta una presa.
Hor chiamo; et non so far altra disesa:
Pur lui; che lombra sua lasciando meco
Di me la uiva et miglior parte ha seco.
Che con l'altra reslai morto in quel punto
Ch'io senti morir lui, che fu il suo core:
Ne son buon d'altro, che da trarre quai.
Tregua non uoglio hauer col mio dolore
In fin chiasia dal giorno ultimo giunto:
Et tanto il piangerò, quant'io l'amai.
Deh perché inanzi a lui non mispoglai
La mortal gonnà; si m'uefli prima?
S'al uivuer sui ueloce; perchè tardo
Sono al morir? un dardo
Almen hauesse et una stessa lima
Parimente ambo noi trafitto et rosso:
Che sì come un uoler sempre ne tenne
Viuendo; casi spenti anchor n'hauesse
Vn'hora, et un sepolro ne chiudeste.
Et se questo al suo tempo, o quel non uenne;

Plate XXIV.—Inscription cut in stone by A. E. R. Gill, 1903 A.D. Reduced (1/3 scale). Note.—To view these incised letters have the light on the left of the plate (or cover with thin tissue paper).

Descriptive Note on p. 486.
Work on the prayer are made in burnished gold with a larger pen.

THE INITIAL A, its frame, the frame of the border, and the "furred" berries (\ldots) are all in burnished gold, outlined black. The "white vine pattern" is rather simpler, and has a rather thicker stalk (in proportion) than that in the previous plate (see above). Its treatment is very similar, but it may be noted that the border is in this case attached to the Initial, and the pattern has almost an appearance of springing from the Initial. The pattern—save one escaped leaf—is straitly confined, by gold bars, throughout the length of the text, but at the ends it is branched out and beautifully flourished in the free margins above and below. These terminals of the pattern having a broad blue outline (dotted white) may be said to carry their background with them.

The (recto) page opposite that shown in the plate has an initial D and a border similarly treated, and each one of the Psalms and Prayers throughout the book is begun in like manner.

**PLATE XX.—One page of an Italian (late) Fifteenth-century MS. Ex libris S. C. Cockerell.**

"From a book containing the Penitential Psalms in Italian, the Psalter of St. Jerome, and various prayers. Written with great delicacy by Mark of Vicenza for some one named Evangelista [see 11th line] in the last quarter of the fifteenth century. Other works of this accomplished scribe are known."—[S. C. C.]

THE VOLUME—of which a complete (recto) page is shown—contains 60 leaves (5\(\frac{1}{2}\) inches by 3\(\frac{3}{4}\) inches): MARGINS, approx.: Inner \(\frac{1}{2}\) inch, Head \(\frac{7}{8}\) inch, Side \(\frac{7}{16}\) inch, Foot \(\frac{13}{16}\) inch.

This very fine WRITING is typical of the practical style and beautiful workmanship which should be the aim of a modern scribe (see pp. 47, 310).

It is written with a very narrow nib, hence the penforms are not so obvious as in some early formal hands;
Notes on the such a hand as the tenth-century MS. (Plate VIII.) and for this reason alone it would be better to practise before seriously attempting to model a hand on the above (see pp. 416, 311, 324, 26).

The use of a fine pen is apt to flatter the unskilled penman, and he finds it hard to distinguish between delicate pen-work which has much character, and that which has little or none. And he will find, after some knowledge of penmanship gained in practice with a broad nib, that the copying of this fine Italian writing—while in reality made much more feasible—may even appear more difficult than before.

CONSTRUCTION.—The pen has a moderate slant—see thin stroke in e. The letters are very square, the tops flat (especially in m, n, and r), and the lower parts flat (as in u). This shows the same tendency that there is in the tenth century and other hands to avoid thin or high arches in the letters.

The feet in some of the letters (in i, for example) are in the nature of stroke-serifs, but the pen probably made these with an almost continuous movement—from the stem.

Note—the fine form of the a;
that b and l have an angle where the stem joins the lower part;
that f was made something like t, and the upper part was added: this was a common mode—see fig. 180 (the f shown in plate is unfortunately not a good specimen);
that g—a very graceful letter—lacks the finishing serif;
that i, p, u have triangular heads, and m, n, r hooks;
that the ascenders have triangular heads, and the descendents p and q, stroke-serifs;
that the ascending and descending stems are longer than the bodies, and the writing is in consequence fairly widely spaced.
Like most of the finest writings, this bears evidences of considerable speed (see pp. 84, 311). Besides the great uniformity of the letters, the finishing strokes are occasionally carried into the succeeding letter, the arches of b, h, m, n, p, r (and the heads of the ascenders) frequently are separated from the stems, and the o and b occasionally fail to join below. These broken forms are the results of speed, and are not to be imitated except as to that which is both a cause and a result—their uniformity (p. 254).

The RULING is in faint ink: there are two vertical marginal lines on the left and one on the right of every page.

The DECORATION of the MS. is very simple. The Initial (here shown) is in green and powder-gold, on a lake ground, with white pattern: there is a very fine brownish outline, probably drawn first. The two upper lines of writing and ||oro are in red.

PLATE XXI. — Italian (early) Sixteenth-century “cursive” or “Italic” MS. Ex libris S. C. Cockerell. (See enlargement, fig. 178.)

“From the Poems of Cardinal Bembo, a fine example of the cursive writing perfected in Italy in the first half of the sixteenth century. The book measures 8½ by 5¾ inches, and contains 79 leaves.”—[S. C. C.]

THE MARGINS of the page from which the plate is taken are approximately: Inner 5/8 inch, Head 3/4 inch, Side 2 inches, Foot 1½ inch. Note.—The lines of writing begin as usual at the left margin, but do not extend to the (true) margin on the right, hence the latter (the side margin on the recto, and the inner margin on the verso) would appear unnaturally wide, but the effect is carried off by the (true) side margins being already exceptionally wide (and by the writing on the backs of the leaves showing through the semi-transparent vellum and so marking the true margins).
Notes on the This mode is very suitable for a book of poems, in which the lengths of the lines of writing may vary considerably, because the writing-line being longer than the ordinary line of writing allows room for extraordinarily long lines, and any appearance of irregularity is carried off by the extra wide side margins.

THE WRITING is very beautiful, clear, and rapid—made with a "slanted pen" (see "Italics," p. 311, and fig. 178). Note the slightness of the slope of the letters (especially of the Capitals), and the length of the stems and the wide spacing.

Note, also, the flatness of the curves in \( a \ c \ d \ e \ g \ o \ q \) and the horizontal top stroke in \( a \ d \ g \ q \), oblique in \( e \) (giving angular tops). The branching away from the stem of the first part of the arch in \( b \ h \ m \ n \ p \ r \) (seen also reversed in \( a \ d \ g \ q \ u \)), and the pointed, almost angular, quality of the arch. This, which is apt to become a fault in a more formal upright hand (see note on Plate XXII.) is helpful in a more rapid running hand, and gives clearance to the junctions of the strokes (r.d)—see fig. 182.

The heads, simple or built-up, hooks tending to become triangular.

The letters in this MS. are rarely coupled.

The very graceful \( g \) has a large pear-shaped lower loop touching the upper part.

PLATE XXII.—"Communion Service" written and illuminated by E. Johnston, A.D. 1902. ("Office Book," Holy Trinity Church, Hastings.) Reduced (nearly \( \frac{3}{4} \) scale).

The MS. on 160 leaves (15 inches by 10 inches) of fine parchment ("Roman Vellum," see p. 173), contains the Communion Service and many collects, epistles and gospels for special festivals, &c. MARGINS: Inner 1\( \frac{1}{8} \) inch, Head 1\( \frac{3}{4} \) inch, Side 2\( \frac{3}{4} \) inches, Foot 3\( \frac{3}{8} \) inches.

484
THE WRITING—after tenth century model (see Notes on the Plate VIII.)—has the fault (referred to at p. 421) of showing too much thin line (running up obliquely), the upper and lower parts of the letters are not flat enough. The tail of the g is inadequate, and the lines of writing are too near together. The writing is readable, however, and fairly regular. The CAPITALS are Uncials (after Plate V.) and occasional “Romans.”

The RUBRIC (“¶ Then shall be said or sung”) is in red, fitted in beside the round initial and marking the top left-hand corner of the page (see footnote, p. 211).

The word “GLORY” (and decoration)—and also the F and T, showing in recto page—are in raised burnished gold, which, it will be seen, has cracked considerably in the G (see p. 164).

The STAVES are in red (p. 140), the notes above GLORY in raised gold, those in the lower stave, black.

The BOOK was of a special nature (see pp. 344-5), being intended for use in a certain church and on certain special festivals: hence a considerable degree of ornament and a generally decorative treatment was permitted (p. 330). The Prayer of Consecration, together with a miniature, occupied a complete opening, the eight margins of which were filled with solid, framing borders (p. 213) in red, blue, green, and gold. Coats-of-arms and other special symbols and devices were introduced on the Title page and in other places.

THE VOLUME consists of 50 + leaves of “Roman Vellum” (7 3/4 inches by 5 3/4 inches).

MARGINS, approx.: Inner 3/4 inch, Head 1 3/16 inch; Side 1 3/8 inch, Foot 2 inches.

THE WRITING, very legible, rather “Gothic-Roman.”
THE CAPITALS are illuminated throughout the text in gold on blue and red grounds. The backgrounds are square, with edges pointed or indented, outlined black, and lined inside white. The INITIAL n is in gold on blue: the moon and stars are in white and gold and white.

THE LINE-FINISHINGS, mostly in black penwork, consist of little groups (sometimes of sprays) of flowers, &c. Sprays from the border separate the “Song” from the “Tale.”

THE MUSIC.—Staves black; Clefs, gold; Notes, red.

THE BORDERS (in the opening from which the plate is taken) frame the text on both pages—nearly filling the margins (see p. 213): the side and foot edges of the (verso) page are shown in the plate. The main pattern is a wild rose, flowers and all, outlined with a rather broad blue line: the stalks and leaves (lined white) are apple-green, the flowers are painted white with raised gold hearts, the thorns are red. Through the wild rose is twined honeysuckle and woody nightshade: stalks—(h) red, (wn) black; and flowers—(h) red with yellow spots, (wn) purplish red with gold centres.

The whole effect is very brilliant and charming. The freedom and naturalness of the “design” remind one of a country hedgerow (p 213), and show that vital beauty which is the essence of true illumination.

PLATE XXIV.—Inscription cut in Stone by A. E. R. Gill, A.D. 1903. Reduced (\(\frac{3}{10}\) scale.) Note.—To view these incised letters have light on the left of plate (or cover with thin tissue-paper).

The STONE—a slab of “Hopton Wood” (p. 395), 30 inches by 18 inches by 2 inches, is intended to go over a lintel. It has a simple moulding. Note how the INSCRIPTION occupies the space (pp. 352, 394): the LETTERS have approximately the same apparent weight (p. 328)—the large stems are more than twice the height of the small; they are only \(\frac{1}{2}\) wider.
Note the strongly marked and elegantly curved serifs; the straight-tailed R; the I drawn out (marking the word IN); the beaked A, M, and N; the Capital form of u.

The letters DEO would be rather wide for ordinary use (p. 270), but as special letters, occupying a wide space,¹ are permissible.

Even in the plate, I think this inscription shows to what a high level modern inscription cutting might be raised by the use of good models and right and simple methods.

¹ Letters in early inscriptions separated as these are indicated each a word (contracted), as S. P. Q. R. (Senatus Populus Que Romanus).

PRINTED IN GREAT BRITAIN AT THE PITMAN PRESS, BATH
Ci—(1088)
FROM PITMAN'S LIST

PRINTING TYPES OF THE WORLD

By ALFRED BASTIEN
and G. J. FRESHWATER

This authoritative work deals fully with lettering and alphabet construction, the securing of harmony and balance, and the methods of obtaining skilful and attractive lay-out. Numerous specimens of type faces are given, with a lucid description of their special features. Invaluable to commercial artists, signwriters, etc.

In crown 4to, 224 pp., illustrated. 15s. net

Sir Isaac Pitman & Sons, Ltd., Parker St., Kingsway, W.C.2
THE WRITING PENS MADE BY WILLIAM MITCHELL ARE ILLUSTRATED BELOW. THEY AIM FOR LEGIBILITY, BEAUTY, AND CHARACTER.

Round Hand Pens for informal writing: eleven degrees of point.

The nibs are made in two series for straight and oblique strokes.

ART PENS IN THREE DEGREES OF POINT.

TO BE OBTAINED OF ALL SCHOLASTIC STATIONERS OR FROM THE MANUFACTURERS WILLIAM MITCHELL PEDIGREE PEN WORKS BEARWOOD ROAD BIRMINGHAM.
Manuscript and Inscription Letters
By Edward Johnston.
These books are intended as a working supplement to the handbook *Writing and Illuminating and Lettering* by the same author, but will form a complete scheme in themselves and will be of value to craftsmen and designers, as well as to instructors and students.
With 5 plates by A. E. R. Gill, 16 plates in all, 12\(\frac{1}{4}\) in. by 9\(\frac{3}{4}\) in. Full notes and descriptions by the author. 7s. 6d. net. Fifth Impression.

Decorative Writing and Arrangement of Lettering
By Prof. Alfred Erdmann, de l'Ecole des Arts Décoratifs de Strasbourg, and Adolphe A. Braun.
The present treatise has in view intending letterers who wish to teach themselves, but the text and instructions are set forth in such a way that experts also can obtain the necessary data on the subject.
Size 9\(\frac{1}{4}\) in. by 6\(\frac{3}{4}\) in., 144 pp., with 59 full-page plates in colour and in black and white, and numerous illustrations. 10s. 6d. net. Second Edition.

Examples of Lettering and Design
By J. Littlejohns, R.B.A., R.B.C., A.R.W.A.
This book consists partly of an adaptation of the Artist’s book on lettering in his “Art for All” Drawing Series. Contains many examples in red and black of formal and decorative lettering, with brief notes on their construction. The author also gives some useful hints on design. All western alphabets are constructed on a few basic shapes—symbolical abstractions, such as the square, circle, and triangle.
In foolscap 4to, 64 pp., fully illustrated. 4s. net.

Plain and Ornamental Lettering
By Edwin J. Fooks.
A practical guide to lettering for ticket and showcard writing, signwriting, and other forms of decorative lettering.
In foolscap 4to, 88 pp., illustrated. 3s. 6d. net.

Sir Isaac Pitman & Sons, Ltd., Parker Street, Kingsway, W.C.2
The artist whose particular forte is Ornamental Lettering and Writing is well acquainted with the steel pens made expressly for this class of work by the masters of Steel Pen Making—Joseph Gillott & Sons.

In the 5005 range of oblique points and the 1143 range of square points will be found a pen to suit every style of Lettering and Writing.

4/- per gross box.
Boxes of 3 dozen assorted 1/6.
Card of 11 pens one of each degree of point, 6d.

When ordering please state whether square or oblique points are required.

Joseph Gillott & Sons, Ltd.,
Pen Makers to His Majesty the King
Victoria Works, Birmingham.
The Art of Landscape Painting
By L. Richmond, R.O.I., R.B.A.
"Thoroughly expounds the principles of landscape painting as well as giving sound advice and instruction as to how to put them into practice in water-colour, oil, or pastel."—The Connoisseur.
In demy 4to, cloth gilt, illustrated with 39 full-page coloured plates and other illustrations. 25s. net.

The Art of Painting in Pastel
"A book which has the special advantage of having been written and illustrated by two artists of repute who have a thorough knowledge of pastel, and use it habitually with power and distinction. Their technical directions are practical and intelligible."—The Studio.
In demy 4to, cloth gilt, 189 pp., including 40 full-page coloured plates and 15 other illustrations. 16s. net.

The Technique of Water-Colour Painting
"The book is quite the best 'guide' that has so far appeared, and of equal value to the beginner as to the mature student."—Apollo.
Size 11½ in. by 8½ in., cloth gilt, 144 pp., with 47 full-page coloured plates. 21s. net. Second Edition.

Etching and Etchings
A Guide to Technique and Print Collecting.
By Frank L. Emanuel, President of the Society of Graphic Art, Exhibitor at the Royal Academy, etc.
"This treatise should prove a joy not only to etchers and collectors but to painters and very many others."—Extract from Foreword by W. Russell Flint, A.R.A.
In demy 4to, cloth gilt, 272 pp., with 238 illustrations. 30s. net.
